Extremely Quiet — EXCLUSIVE DESIGN
Single & Two Stage
Self Venting
Transfer rates to 270 GPH (with 1000SSU Oil)
Pressures to 300 PSI
Speeds to 3450 RPM
Handles Light to Heavy Oil 34 to 1000SSU
Flange Mounting
Internal Regulation (100 & 300 PSI)
Double Lip Seal for Hydraulic Transient Protection
U/L Listed

SINGLE STAGE

TWO STAGE

Quietness Designed in:

The Webster 'V' Series Fuel Pumps were specifically designed to meet the high delivery requirements of commercial, industrial and institutional systems — and with a minimum of mechanical and hydraulic noise. To meet these requirements, Webster engineers chose to use inherently quiet, precision ground, gerotor type gears in place of spur gears commonly used in high capacity units. Each pump stage is made up of two gear sets displaced from each other by $\frac{1}{2}$ cycle providing a pulse cancellation oil flow, further insuring the quiet operation demanded by hospitals, nursing homes and apartments.

Large Capacity—Hi-Lift:

Single and two stage models are available for two pipe operation. The single stage units provide a transfer rate as high as 270 GPH (with 1000 SSU oil) at up to 10" Hg inlet vacuum. Two stage transfer rates are as high as 205 GPH (with 1000 SSU oil) at up to 15" Hg inlet vacuum. See chart page 4.

Dependable Pressure Regulation:

When used for direct firing, the 'V' series incorporate an integral regulating valve. These precision machined valves are factory pre-set for 100 or 300 PSI operation and can be easily readjusted in the field to meet a specific system requirement. Models are also available without the built-in valve for use as supply or transfer pumps. In all cases separate valves are required for nozzle shut-off.

Long Life Design:

The precision ground shaft runs in three large heavy duty bearings — five in the two stage models — extending pump life and reducing shaft noise. A double lip shaft seal eliminates leakage due to transient pressures while excluding damaging foreign matter. All parts are housed in a fine grained cast iron accurately machined body

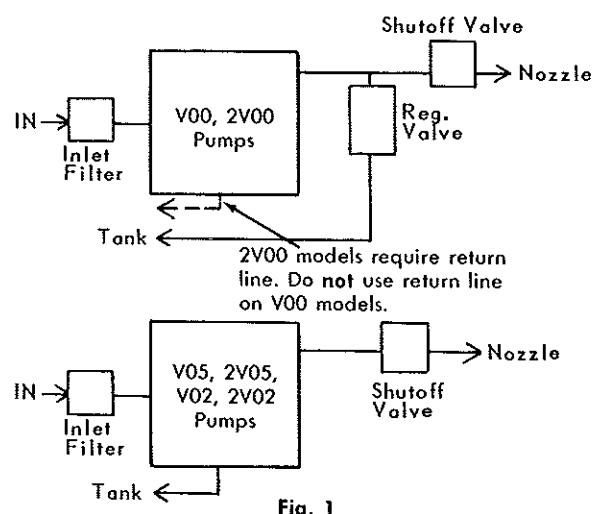

which provides excellent noise dampening to assure quiet operation.

Versatility In Application

These pumps may be either flange or hub mounted to any standard burner. Optional porting simplifies piping. (See Fig. 2) 'V' series pumps can be used over a wide range of speeds and flow rates. The series however, does not incorporate an internal filter. An adequately sized inlet line filter must be used where filtering is indicated. (See Fig. 1) Inlet vacuum measured at the pump inlet must not exceed 10" Hg for single stage models, or 15" Hg for two stage versions. Webster 'V' series pumps are UL listed.

Installation Note

DO NOT USE TEFLON TAPE. It tends to break, depositing small pieces in critical internal areas of the fuel unit. Therefore, use of teflon tape will void all warranties.

Note: Max. Recommended Firing Rates apply to 10" Hg for Single Stage Units and 15" Hg for Two Stage Units.

(As viewed from shaft end)

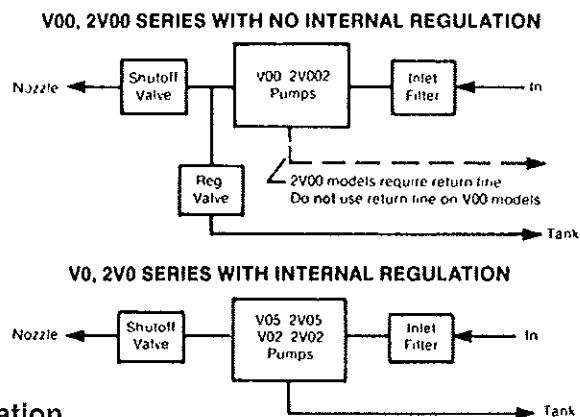

Note: To assure compliance with National Fire Protection Association's bulletin 31, "Installation of Oil Burning Equipment," fuel unit inlet pressure should not exceed 3 psig.

INSTALLATION DATA

V Series pumps are shipped from the factory set for two-pipe operation. They are not recommended for use in one-pipe systems (except series V00, see Note 1).

IMPORTANT: Do not loosen or try to tighten any pump plugs not to be used in the installation. **NON-HARDENING OIL PIPE DOPE IS RECOMMENDED** for use on the threads of all fittings. Teflon tapes or paste must be used with care to prevent depositing tape pieces or fibers into critical internal areas of the pump. Reduced torques must be used with teflon materials to avoid thread or casting damage. **EVIDENCE OF TEFLON MATERIAL IN INTERNAL AREAS OF THE FUEL-UNIT WILL BE CAUSE TO VOID WARRANTY.**

Installation

1. Connect inlet line to preferred INLET PORT. Use of inlet in cover is recommended for minimum inlet vacuum loss. Connect nozzle line to nozzle port.
2. Connect return line to preferred RETURN PORT except on V00 pumps. Use of bottom return is recommended to minimize back pressure. Top return port not recommended for oil heavier than #2.
3. Plug all unused ports securely.
4. Start burner. Two-stage and most one-stage pumps will self-vent. V00 with shut-off valve in nozzle line may have to be vented manually by loosening GAGE PORT plug. Tighten plug securely when oil flows clear.

Installation Notes:

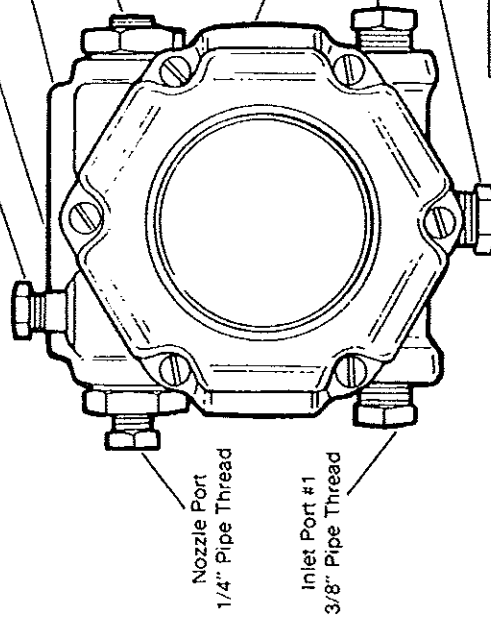

"Fuel unit inlet pressures should not exceed 3 psig in order to comply with National Fire Protection Association's Bulletin 31."

To assure maximum performance, INLET VACUUM, measured at unused INLET PORT, should not exceed 10" Hg on single-stage pumps or 15" Hg on two-stage pumps.

NOTE: Max Recommended Firing Rates apply to 10" Hg for single-stage units and 15" Hg for two-stage units.

Body Style D

Clockwise Rotation (CW from Shaft End)

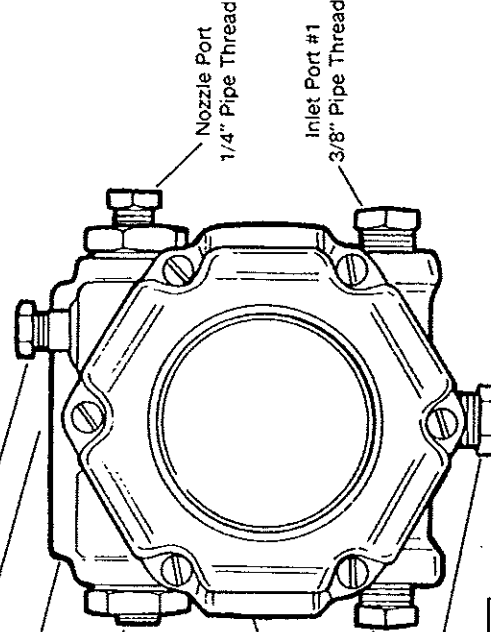

Nozzle Port
1/4" Pipe Thread

Inlet Port #1
3/8" Pipe Thread

Body Style C

Counterclockwise Rotation (CCW from Shaft End)

Nozzle Port
1/4" Pipe Thread

Inlet Port #1
3/8" Pipe Thread

Gage Port, 1/4" Pipe Thread
Optional Return Port,
1/4" Pipe Thread

Port Nearest Pressure
Adjust Plug Is Not Used

To Adjust Pressure: (Except
2V00 & V00 Series, See Note 1.)
Remove cover screw. Insert 1/8"
Allen wrench. Turn counter-
clockwise to below pressure
desired. Turn clockwise to set
desired pressure. Keep cover
screw tight except when adjust-
ing pressure.

Cover Inlet Port
1/2-14 Pipe Thread

Inlet Port #2
3/8" Thread

Return Port, 3/8" Pipe Thread
Connect as Shown Below

NOTE 1: Do not connect return line to V00 Series pump.
Keep both return ports plugged. V00 and 2V00 do not have
internal regulation. Use external regulation if required.
Return line **must** be connected to 2V00 models.
