MWC Series
Mid Efficiency Gas-Fired Hot Water Direct Vent Condensing Boilers

INSTALLATION INSTRUCTIONS
These instructions must be affixed on or adjacent to the boiler.

Models:
- MWC116ENT
- MWC116ELT
- MWC116ENL
- MWC116ELL

WARNING: Improper installation, adjustment, alteration, service or maintenance can cause property damage, injury, or loss of life. For assistance or additional information, consult a qualified installer, service agency or the gas supplier. This boiler requires a special venting system. Read these instructions carefully before installing.

   Vented Appliances In The Commonwealth of Massachusetts
I Product Description

The MWC Series are gas fired condensing boilers designed for use in forced hot water heating systems requiring supply water temperatures of 176°F or less and return water temperatures greater than 86°F. The primary heat exchanger is a copper water tube design. Additional heat is extracted from the flue gas in a stainless steel secondary heat exchanger located downstream of the inducer. These boilers include a built in circulator, expansion tank, and automatic air vent. In addition, “combi” models include a plate exchanger for domestic hot water (DHW) generation. All MWC Series boilers are designed for installation on a wall and may be vented vertically or horizontally with combustion air supplied from outdoors.

III Before Installing

1) Safe, reliable operation of this boiler depends upon installation by a professional heating contractor in strict accordance with this manual and the authority having jurisdiction.

   • In the absence of an authority having jurisdiction, installation must be in accordance with this manual and the National Fuel Gas Code, ANSI Z223.1./NFPA 54 and/or CAN/CSA B 149.1 Natural Gas and Propane Installation Code.
   • Where required by the authority having jurisdiction, this installation must conform to the Standard for Controls and Safety Devices for Automatically Fired Boilers (ANSI/ASME CSD-1).

2) Read Section VII to verify that the maximum combustion air and exhaust pipe lengths will not be exceeded in the planned installation. Also verify that the vent terminal can be located in accordance with Section VII.

3) Make sure that the boiler is correctly sized:
   a) For heating systems employing convection radiation (baseboard or radiators), use an industry accepted sizing method such as the I=B=R Heat Loss Calculation Guide (Pub. #H21 or #H22) published by the Hydronics Institute in Berkeley Heights, NJ.
   b) In sizing the boiler take into consideration the following boiler water flow/temperature limitations:
      • Maximum regulated supply temperature is 176°F
      • Maximum flow through the boiler is approximately 5.5GPM.
      • Minimum boiler temperature rise is approximately 37°F at high fire.
   c) For new radiant heating systems, refer to the radiant tubing manufacturer’s boiler sizing guidelines.
   d) For combi boilers make sure that the domestic hot water flow rate shown in Table 2.2, will be adequate to meet the peak demand for domestic hot water.

5) Make sure that the boiler received is configured for the correct gas (natural or LP).

6) Make sure that the boiler is configured for use at the altitude at which it is to be installed.

NOTICE

This product must be installed by a licensed plumber or gas fitter when installed within the Commonwealth of Massachusetts. See Appendix A for additional important information about installing this product within the Commonwealth of Massachusetts.

IV Locating the Boiler

1) Observe the minimum clearances shown in Figure 4.1. These clearances apply to both combustible and non-combustible materials.

2) Note the recommended service clearances in Figure 4.1. These service clearances are recommended, but may reduced to the combustible clearances provided:

   • Access to the front of the boiler is provided through a door
   • Access is provided to the condensate trap located underneath the boiler.

3) The relief valve must be installed in the factory specified location.

4) The boiler should be located so as to minimize the length of the vent system.

5) The boiler must not be installed on carpeting.

6) The combustion air piping must terminate where outdoor air is available for combustion and away from areas that will contaminate combustion air. Avoid areas near chemical products containing chlorine, chloride based salts, chloro/fluorocarbons, paint removers, cleaning solvents and detergents.
CLEARANCES TO COMBUSTIBLE & NON-COMBUSTIBLE CONSTRUCTION:

THIS BOILER IS APPROVED FOR CLOSET INSTALLATION WITH THE FOLLOWING MINIMUM CLEARANCES:

TOP = 10"
FRONT = 3"
SIDES = 2"
BOTTOM = 8"

RECOMMENDED SERVICE CLEARANCES:

TOP = 10"
FRONT = 24"
SIDES = 6"
BOTTOM = 24"

THESE SERVICE CLEARANCES ARE RECOMMENDED, BUT MAY BE REDUCED TO THE MINIMUM CLEARANCES PROVIDED:
1. ACCESS TO THE FRONT OF THE BOILER IS PROVIDED THROUGH A DOOR.
2. ACCESS IS PROVIDED TO THE CONDENSATE TRAP AND UNIONS LOCATED UNDERNEATH THE BOILER.

Figure 4.1: Clearances To Combustible Or Non-combustible Material
V Mounting The Boiler

CAUTION

This boiler weighs approximately 110 pounds:

• Two people are required to safely lift this boiler onto the wall mounting hook.
• Make sure that wall mounting hook is anchored to a structure capable of supporting the weight of the boiler and attached piping when filled with water.

Jurisdictions in areas subject to earthquakes may have special requirements for supporting this boiler. These local requirements take precedence over the requirements shown below.

Mounting Steps:

1) If the boiler is installed on a framed wall, minimum acceptable framing are 2 x 4 studs. The boiler mounting holes are on 11-5/8” centers. Usually the wall studs will be on 16” centers. In such cases, both boiler bracket mounting holes must be anchored to ¾” Plywood, horizontal 2 x 4s anchored to the studs, or some other framing system capable of supporting the boiler. Attachment of either bracket hole to wallboard alone is unacceptable.

2) When mounting this boiler directly onto studs covered with 1/2” wall board, 5/16 x 2” lag screws are recommended. When the boiler is attached to other types of construction, such as masonry, use fasteners capable of supporting the weight of the boiler and attached piping in accordance with good construction practice and applicable local codes.

3) Make sure that the surface to which the boiler is mounted is plumb.

4) Before mounting the boiler, make sure that wall selected does not have any framing or other construction that will interfere with the vent pipe penetration.

5) Tape the paper template to the wall in the chosen location. Be sure to level the template.

6) Pre-drill two holes in the center of the “oval” slots on the mounting bracket sized for the hardware being used.

7) Mount the bracket to the wall. Be sure to level the bracket by adjusting the screw in the vertical slot.

8) Pre-drill the remaining hole in the mounting bracket and secure the final screw.

9) Cut the opening in the wall for the vent system. The recommended hole diameter for the standard 60/100mm venting is 4-3/8”.

10) Hang the boiler on the wall bracket as shown in Figure 5.2.

11) Verify that the front and sides of the boiler are plumb.

12) See Section VII (“Venting) for instructions on attaching the vent system to the boiler.

13) A hot water boiler installed above radiation level or as the Authority having jurisdiction, must be provided with a low water cutoff device either as a part of the boiler or at the time of installation.

- Suitable Fasteners (See Text)
- 3/4 Plywood or Equivalent Construction Secured to Studs (Required when Studs not on 11-5/8 Centers)
- 2 x 4 Wall Stud

Boiler
VI Air for Ventilation

WARNING

Outdoor combustion air must be piped to the air intake. Never pipe combustion air from areas containing contaminates such as areas where swimming pool chemicals are stored. Contaminated combustion air will damage the boiler and may cause property damage, personal injury or loss of life.

Air for combustion and ventilation, of the National Flue Gas Code, ANSI Z223.1/NFPA 54 CAN/CSA B 149.1 Natural Gas and Propane Installation Code, or applicable provisions of the local building codes.

Air for combustion must always be obtained directly from outdoors, however sufficient air for ventilation must still be provided in the boiler room. Air for ventilation is required to keep various boiler components from overheating and is always obtained from indoors. To ensure an adequate ventilation air supply, perform the following steps:

Step 1: Determine whether the boiler is to be installed in a confined space - A confined space is defined by the National Fuel Gas Code, ANSI Z223.1/NFPA 54 and/or CAN/CSA B 149.1 Natural Gas and Propane Installation Code, as having a volume less than 50 cubic feet per 1000 BTU/hr input of all appliances installed in that space. To determine whether the boiler room is a confined space:

A. Total the input of all appliances in the boiler room in thousands of BTU/hr. Round the result to the next highest 1000 BTU/hr.

B. Find the volume of the room in cubic feet. The volume of the room in cubic feet is:

\[ \text{Length (ft)} \times \text{width (ft)} \times \text{ceiling height (ft)} \]

In calculating the volume of the boiler room, consider the volume of adjoining spaces only if no doors are installed between them. If doors are installed between the boiler room and an adjoining space, do not consider the volume of the adjoining space, even if the door is normally left open.

C. Divide the volume of the boiler room by the input in thousands of BTU/hr. If the result is less than 50, the boiler room is a confined space.

Example:

A MWC116 and a water heater are to be installed in a room measuring 6ft – 3 in x 7ft with an 8 ft ceiling. The water heater has an input of 30000 BTU/hr:

Total input in thousands of BTU/hr = \((116000 \text{ BTU/hr} + 30000 \text{ BTU/hr}) / 1000 = 146 \text{ MBTU/hr}\)

Volume of room = \(6.25 \text{ ft} \times 7 \text{ ft} \times 8 \text{ ft} \times 350 \text{ ft}^3\)

\(350/146 = 2.40\). Since 2.33 is less than 50, the boiler room is a confined space.

Step 2a: If the boiler is to be placed in a confined space, provide two openings into the boiler room, one near the floor and one near the ceiling. The top edge of the upper opening must be within 12” of the ceiling and the bottom edge of the lower opening must be within 12” of the floor (Fig 6.1). The minimum opening dimension is 3 inches.

- If the MWC boiler is the only gas-burning appliance in the boiler room, these openings must each have a minimum free area of 54 square inches.
- If other gas-burning appliances are in the boiler room, size the openings in accordance with the appliance manufacturer’s instructions or the National Fuel Gas Code ANSI Z223.1/NFPA 54 and/or CAN/CSA B 149.1. Minimum opening free area is 54 square inches even if opening requirements for other appliances are less.
Figure 6.1: Boiler Installed In A Confined Space, Ventilation Air From Inside

Step 2a (contd.)

- If the total volume of both the boiler room and the room to which the openings connect is less than 50 cubic feet per 1000 BTU/hr of total appliance input, install a pair of identical openings into a third room. Connect additional rooms with openings until the total volume of all rooms is at least 50 cubic feet per 1000 BTU/hr of input.
- The “free area” of an opening takes into account the blocking effect of mesh, grills, and louvers. Where screens are used, they must be no finer than ¼” (4 x 4) mesh.

Step 2b: If the boiler is to be placed in an unconfined space the natural infiltration into the boiler room will provide adequate air for ventilation without additional openings into boiler room.
VII Venting

WARNING

Failure to vent this boiler in accordance with these instructions could cause flue gas to enter the building resulting in severe property damage, personal injury, or death:

- Do not attempt to vent this boiler with galvanized, PVC, or any other vent components not listed in Table 7.3.
- Do not obtain combustion air from within the building.
- Do not install a barometric damper or draft hood on this boiler.

CAUTION

Moisture and ice may form on the surfaces around the vent termination. To prevent deterioration, surfaces should be in good repair (sealed, painted, etc.).

A. Vent System Design

There are two basic ways to vent this boiler:

- **Horizontal (“Side Wall”) Concentric Venting** - Vent system exits the building through an outside wall. Concentric venting consists of a “pipe within a pipe”. Flue gas exits the building through the inner pipe and combustion air is drawn into the boiler through the space between the inner and outer pipe.
- **Vertical Concentric Venting** - Vent system exits the building through the roof. Concentric venting consists of a “pipe within a pipe”. Flue gas exits the building through the inner pipe and combustion air is drawn into the boiler through the space between the inner and outer pipe.

Both of these systems are considered “direct vent” because in both, combustion is drawn directly from the outdoors into the boiler. A description of all of these venting options are shown in Tables 7.1 and 7.6. For clarity, these vent options are numbered from 1 to 6. One of the vent option columns in Tables 7.1 or 7.6 must match the planned vent and air intake system exactly. In addition, observe the following guidelines:

1) **Approved vent systems** - Use only one Concentric vent system components supplied by Crown. The standard boiler is supplied with a concentric vent system having a maximum usable length of 25” (Figure 2.1). For longer runs, additional straight lengths and elbows are available from Crown. In some cases, larger diameter concentric pipe must be used. Each Crown concentric vent component consists of an inner pipe of polypropylene and the outer pipe of steel. Integral gaskets on each concentric fitting provide a gas tight seal. A list of all Crown concentric vent components is shown in Table 7.3.

   In this manual, concentric pipe sizes are called out in terms of the inner and outer pipe nominal diameters in millimeters. For example, “60/100mm” pipe consists of a 60mm exhaust pipe inside a 100mm diameter outer pipe.

2) **Maximum Vent and Air Intake Lengths** - The maximum length of the vent air intake piping depends upon the vent option selected. See Table 7.1 or 7.6 for the maximum vent length. In horizontal vent systems, the lengths shown in Table 7.1 are in addition to the Elbow Adaptor on top of the boiler. If more elbows are desired, the maximum allowable vent length must be reduced by the amount shown in Table 7.5 for each additional elbow used. Termination fittings are never counted, although the length of the concentric terminal section is counted.
Example: A 60/100mm concentric vent system is planned for a horizontally vented MWC116 which has the following components:

- 60/100mm Elbow Adaptor (supplied with the boiler)
- 1 ft Straight Pipe
- 90 elbow
- Uncut Terminal Section (supplied with the boiler)

The Vent Option #2 column in Table 7.1 describes a horizontal direct vent system using 60/100mm concentric vent pipe. From this column, we see that a MWC116 may have a vent length of up to 8ft-10in. The 60/100 Elbow Adaptor supplied with the boiler is not considered. The length of the terminal section (not including the plastic terminal itself) is approximately 22 1/2” (1.9ft) installed. From Table 7.5, we see that the equivalent length of the 60/100mm elbow is 4.5ft. The total equivalent length of the planned venting system is therefore:

\[
1\text{ft (Straight ) + 4.5ft (90 Elbow) + 1.9ft (Uncut Terminal Section) = 7.4ft.}
\]

Since Table 7.1 shows a maximum allowable vent length of 8ft-10in, the planned vent system length is acceptable. Note that the 82mm inlet air orifice supplied with the boiler is not used.

3) **Minimum Vent and Air Intake Lengths** - Observe the minimum vent lengths shown in Tables 7.1 and 7.6.

4) **Permitted Terminals for Horizontal Venting:**

- **Vent Option 1, 2** - The 60/100mm concentric vent terminal is supplied with the boiler as part of the standard vent system.
- **Vent Option 3** - Use the optional 80/125mm Concentric Vent Terminal (Crown PN 230531)

5) **Horizontal Vent Terminal Location** - Observe the following limitations on the vent terminal location (also see Figure 7.4).

- Vent terminal must be at least 1 foot from any door, window, or gravity inlet into the building.
- The bottom of the terminal must be at least 12” above the normal snow line. In no case should it be less than 12” above grade level.
- The bottom of the vent terminal must be at least 7 feet above a public walkway.
- Do not install the vent terminal directly over windows or doors.
- The bottom of the vent terminal must be at least 3 feet above any forced air inlet located within 10 feet.
- In the USA, maintain a clearance of at least 4ft horizontally from the vent terminal to gas meters, electric meters, regulators and relief equipment. In Canada, maintain a 6ft clearance between the vent terminal and these devices.
- Do not locate the vent terminal under decks or similar structures.
- Top of vent terminal must be at least 5 feet below eves, soffits, or overhangs. Maximum depth of overhang is 3 ft.
- Vent terminal must be at least 6 feet from an inside corner.
- Vent Terminal must be at least 2ft from adjacent buildings.
- Under certain conditions, water in the flue gas may condense, and possibly freeze, on objects around the vent terminal including on the structure itself. If these objects are subject to damage by flue gas condensate, they should be moved or protected.
- If possible, install the vent and air intake terminals on a wall away from the prevailing wind. Reliable operation of this boiler cannot be guaranteed if these terminals are subjected to winds in excess of 40 mph.
- Air intake terminal must not terminate in areas that might contain combustion air contaminates, such as near swimming pools. See Section IV for more information on possible contaminates.

Table 7.3b Notes:
1) Vertical terminal can be used with either of the roof flashings listed beneath it.
2) Sloped roof flashing suitable for roof angles between 25 and 45 degrees.
3) Used at base of vertical run inside unused masonry chimney.
Figure 7.4a: Location Of Vent Terminal Relative To Windows, Doors, Grade

Figure 7.4b: Location Of Vent Terminal Relative To Meters And Forced Air Inlets

Figure 7.4c: Positioning Vent Terminal Under Overhangs
6) Permitted Terminals for Vertical Venting - Use Crown PN 230532 with the appropriate flashing (Table 7.3b)

7) Vertical Vent Terminal Locations (Vent Option 5) - Observe the following limitations on the location of all vertical vent terminals (see Figure 7.7):
   - The top of the vent pipe must be at least 2 feet above any object located within 10 feet.
   - The bottom of the air inlet terminal must be at least 12” above the normal snow accumulation that can be expected on the roof. The terminal used in Vent Option #5 has a fixed distance above the storm collar of 19”. If a greater distance is needed to provide the clearance above the snow line, build a chase on the roof and mount the vertical terminal on top of the chase.

8) Wall thimbles – Concentric vent has a “zero” clearance to combustibles and therefore does not require the use of wall thimbles.

9) Pitch of Horizontal Piping - Pitch all horizontal piping so that any condensate which forms in the piping will run towards the boiler. Pitch Crown horizontal concentric venting 5/8” per foot

10) Supporting Pipe - Vertical and horizontal sections of pipe must be properly supported. Support Crown concentric venting near the female end of each straight section of pipe. Exception: Vertical runs of concentric pipe in an unused chimney (Figure 7.36) need only be supported at the terminal and at the base of the run.

Figure 7.7: Vertical Concentric Vent System (Vent Option 5)
B. Removing an Existing Boiler From a Common Chimney

Read this only if the MWC boiler is replacing an existing boiler that is being removed from a common chimney. This section does not apply to the installation of a MWC boiler.

In some cases, when an existing boiler is removed from a common chimney, the common venting system may be too large for the remaining appliances. At the time of removal of an existing boiler, the following steps shall be followed with each appliance remaining connected to the common venting system placed in operation, while the other appliances remaining connected to the common venting system are not in operation.

(a) Seal any unused openings in the common venting system.
(b) Visually inspect the venting system for proper size and horizontal pitch and determine there is no blockage or restriction, leakage, corrosion and other deficiencies which could cause an unsafe condition.
(c) Insofar as practical, close all building doors and windows and all doors between the space in which all the appliances remaining connected to the common venting system are located and other spaces of the building. Turn on clothes dryers and any appliance not connected to the common venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they will operate at maximum speed. Do not operate a summer exhaust fan. Close fireplace dampers.
(d) Place in operation the appliance being inspected. Follow the lighting instructions. Adjust thermostat so the appliance will operate continuously.
(e) Test for spillage at the draft hood relief opening after 5 minutes of main burner operation. Use the flame of a match or candle, or smoke from a cigarette, cigar, or pipe.
(f) After it has been determined that each appliance remaining connected to the common venting system properly vents when tested as outlined above, return doors, windows, exhaust fans, fireplace dampers and any other gas-burning appliances to their previous condition of use.
(g) Any improper operation of the common venting system should be corrected so the installation conforms with the National Fuel Gas Code, ANSI Z223.1./NFPA 54 and/or CAN/CSA B 149.1 Natural Gas and Propane Installation Code. When re-sizing any portion of the common venting system, the common venting system should be re-sized to approach the minimum size as determined using the appropriate tables in Part 11 of the National Fuel Gas Code, ANSI Z223.1./NFPA 54 and/or CAN/CSA B 149.1

WARNING

Never common vent a MWC boiler with other appliances.
C. Assembly of Crown 60/100mm Concentric Venting

(IMPORTANT - Skip to Section D for 80/125mm Concentric Vent Assembly)

WARNING

Failure to follow the instructions could result in flue gas leakage into the combustion air or indoor air, resulting in unsafe or unreliable operation.

- Do not lubricate concentric gaskets with anything other than water.
- Do not attempt to cut any piping except as permitted in this section. When cutting these sections, make sure all cuts are square and allow for proper insertion.
- Do not attempt to try to mix this concentric pipe with other venting systems.

1) Concentric vent components supplied with the boiler are packed in a separate carton and include the following:
   a) 60/100mm elbow adaptor (Crown PN 340509).
   b) 60/100mm terminal section (straight section with a terminal and overall length of 27 3/4” (Crown PN 230520).
   c) Two (2) Rubber wall grommets (Crown PN 230522).
   d) Vent gasket and screws for attachment of vent system to boiler.

The 82mm air inlet orifice required for Vent Option 1 is packed in the boiler carton.

The 60/100 straight adaptor is optional equipment. It is supplied with the same screws and gasket as the 60/100 elbow adaptor.

2) Start by attaching the elbow adaptor (or straight adaptor, if used instead) to the top of the boiler using the gasket and four 4.2mm sheet metal screws provided in the vent kit as shown in Figure 7.20. For Vent Option 1, install the 82mm air inlet orifice as shown.

3) If no additional sections of concentric pipe are required, attach the terminal section to the elbow. In most cases, it will need to be cut before doing so. Use the following procedure to cut the pipe:
   a) Measure distance “L” from the outside surface of the exterior wall to the end of the elbow as shown in Figure 7.21.
   b) Add 2-1/8” to distance “L”. Carefully mark this length on the pipe as shown in Figure 7.22.
   c) Press in the two tabs holding the plastic terminal in the terminal section (Figure 7.22). Carefully pull out the terminal and the inner pipe.
   d) Cut the outer pipe only at the point marked in Step (b) using aviation shears, a hacksaw, or an abrasive wheel cutter. Be careful to cut the pipe square. De burr the cut end with a file or emery cloth.
   e) Cut the plastic inner pipe so that it will protrude 3/8” beyond the outer pipe when reinstalled in the terminal section (Figure 7.23). Use a fine tooth hacksaw or a PVC saw to cut the plastic pipe and be careful to cut the pipe square. De burr the cut edge of the plastic pipe with a file, razor blade, or fine sandpaper.
   f) Reinstall the inner pipe in the terminal section. Slip the outside wall grommet over the terminal section and position so that it covers the joint between the outer pipe and the terminal (Figure 7.24).
   g) Make a mark on the terminal section 1” from the cut end of the outer pipe as shown in Figure 7.24.
   h) Pass the terminal section through the wall from the outside. Push the remaining wall grommet over the terminal section on the inside of the wall. Push the terminal section into the elbow until the mark made in Step (g) is no longer visible. If necessary, the brown gasket in the inner pipe may be lubricated with a few drops of water.
   i) The terminal section must be attached to the elbow with a single #10 x 1/2” sheet metal screw (not supplied) at the top of the elbow. Drill a 1/8” hole in the location shown in Figure 7.25. Use a short drill bit or a drill stop to ensure that the drill bit does not penetrate the pipe by more than 3/8”. Install a #10 x 1/2” screw in this hole. Do not use a screw longer than 1/2” long.
   j) If not already done, make sure that both wall grommets are firmly against the interior and exterior wall surfaces. Seal any cracks or other openings near the terminal through which exhaust could enter the building.
FIGURE 7.20: INSTALLATION OF 60/100 ADAPTORS ON BOILER

FIGURE 7.21: DIMENSION “L”
4) If additional pieces of pipe are used, install them starting at the boiler elbow. Support each section of straight pipe at its female end.

5) Use locking bands provided to join adjacent sections of non-cuttable pipe as well as fittings. The male end of the terminal section and other cuttable sections must be held to the female end of the adjoining pipe with at least three #10 x 1/2" sheet metal screws. Drill a 1/8" hole through both outer pipes to start this screw. **Use a drill stop or other means to ensure that the drill bit does not penetrate more than 3/8" into the outer pipe. Do not use a sheet metal screw longer than 1/2".**

6) The only straight pipe that can be cut is the terminal section and the 19-1/2" section (Crown PN 230506). To cut this pipe:
   a) Cut pipe from the male end. After marking the desired length of the outer pipe, remove the plastic inner pipe by pulling it out from the female end.
   b) **Cut the outer pipe only** at the point marked in Step (b) using aviation shears, a hacksaw, or an abrasive wheel cutter. Be careful to cut the pipe square. De burr the cut end with a file or emery cloth.
   c) Cut the plastic inner pipe so that it will protrude 3/8" beyond the outer pipe when reinstalled in the outer pipe. Use a fine tooth hacksaw or a PVC saw to cut the plastic pipe and be careful to cut the pipe square. De burr the cut edge of the plastic pipe with a file, razor blade, or fine sandpaper.
   d) Reinstall the inner pipe.

7) Install the terminal as outlined in Step (4) above. Dimension “L” described in Step 3 is the distance from the exterior surface of the wall to the end of the last piece of pipe inside the building.

![Figure 7.22: Cutting Outer Pipe](image)

![Figure 7.23: Cutting Inner Pipe](image)
Figure 7.24: Preparing 60/100mm Terminal Section For Installation In The Wall

Figure 7.25: Attaching 60/100mm Terminal Section
D. Assembly of Crown 80/125mm Concentric Venting

(IMPORTANT - See Section C for 60/100mm Concentric Vent Assembly)

**WARNING**

Failure to follow the instructions could result in flue gas leakage into the combustion air or indoor air, resulting in unsafe or unreliable operation.

- Do not lubricate concentric gaskets with anything other than water.
- Do not attempt to cut any piping except as permitted in this section. When cutting these sections, make sure all cuts are square and allow for proper insertion.
- Do not attempt to try to mix this concentric pipe with other venting systems.

1) The 60/100mm terminal section and concentric reducing elbow supplied with the boiler are not used in 80/125mm vent systems. The components listed in Table 7.3b are required for 80/125mm installations and are not supplied with the boiler. Before starting assembly of an 80/125mm vent system, make sure that the planned installation is in accordance with the “Vent System Design” section of this manual and that all required 80/125mm vent components are on hand. These components are available through Crown distributors.

![Figure 7.30: Installation Of 80/125 Adaptor On Boiler](image-url)
2) Installation of the MWC116 with 80/125mm venting requires the use of the 80/125mm appliance adaptor (Crown PN 340523). This adaptor is installed on top of the boiler as shown in Figure 7.30. For vent options 3 and 5, sandwich the 82mm air inlet orifice between the boiler and the adaptor as shown.

3) **Cutting Straight Pipe** - The following straight pipe sections may be cut:

<table>
<thead>
<tr>
<th>Part #</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>230517</td>
<td>19 1/2&quot; Straight</td>
</tr>
<tr>
<td>230515</td>
<td>39&quot; Straight</td>
</tr>
</tbody>
</table>

These sections have a plain male end (without beads - see Figure 7.31a). They are always cut from the male end. **Sections not shown on the above list may not be cut.** These sections have beads on the male end (Figure 7.31b).

![Figure 7.31a: Cuttable Straight Section](image)

![Figure 7.31b: Non Cuttable Straight Section](image)
3) (contd.) To cut the straight sections listed above refer to Figure 7.32 and the following instructions:

a) Determine the required length of the outer pipe. When doing this allow an additional 1" of length for insertion into the female end of the adjoining pipe. Mark the cut line on the outer pipe.
b) Remove the plastic inner pipe by pulling it out from the female end.
c) Cut the OUTER PIPE ONLY at the point marked in Step (a) using aviation shears, a hacksaw, or an abrasive wheel cutter. Be careful to cut the pipe square. De burr the cut end with a file or emery cloth.
d) Make an insertion mark 1" from the male end of the outer pipe.
e) Cut the plastic inner pipe so that it will protrude 3/8" beyond the male end of the outer pipe when reinstalled in the outer pipe. Use a fine tooth hacksaw or a PVC saw to cut the plastic pipe and be careful to cut the pipe square. De burr the cut edge of the plastic pipe with a file, razor blade, or fine sandpaper.
f) Reinstall the inner pipe.

4) Joining Pipe -

a) Start assembly of the vent system at the boiler. Lubricate the brown gasket in the boiler vent collar with a few drops of water.
b) Push the male end of the first fitting into the boiler collar until it bottoms out. The male end of cuttable sections should go 1" into the collar until the insertion mark (made in Step 3d above) is covered. On other fittings, the bead on the male pipe will bottom out on the collar (Figure 7.33b).
c) The male end of cuttable fittings must be held to the collar with three #10 x 1/2" sheet metal screws. Drill a 1/8 hole through both outer pipes to start this screw. **Use a drill stop or other means to ensure that the drill bit does not penetrate more than 3/8" into the outer pipe. Do not use a sheet metal screw longer than 1/2"** (Figure 7.33a).
d) Use locking bands (provided with all fittings) to secure non-cuttable pipe, as well as fittings, to the boiler collar (Figure 7.33b).
e) Use the same method to join all remaining vent components except for the terminal.
Figure 7.33a: Joining Cuttable Pipe

Figure 7.33b: Joining Non-Cuttable Pipe
5) **80/125mm Horizontal Terminal Installation**

a) Cut a 5-1/2" diameter hole through the exterior wall at the planned location of the horizontal terminal.
b) Measure distance “L” from the outside surface of the exterior wall to the end of the last fitting as shown in Figure 7.34a.
c) Add 1-1/4" to distance “L”. Carefully mark this length on the pipe as shown in Figure 7.34b.
d) Remove the inner pipe from the terminal, by gently pulling on it from the male end. Set aside.
e) Cut the outer pipe only at the point marked in Step (c) using aviation shears, a hacksaw, or an abrasive wheel cutter. Be careful to cut the pipe square. De-burr the cut end with a file or Emory cloth.
f) Reinstall the inner pipe in the terminal, making sure that the female end of this pipe is completely bottomed out over the aluminum male connection visible behind the air intake grill. Place a mark on the inner pipe 3/8" beyond the end of the outer pipe (Figure 7.34c). Use a fine tooth hacksaw to cut the pipe and be careful to cut the pipe square (if necessary, the pipe can be removed from the terminal again for cutting). De-burr the cut edge of the pipe with a file, razor blade, or fine sandpaper.
g) Make a mark on the terminal section 1" from the cut end of the outer pipe as shown in Figure 7.34c.
h) Slip the terminal section through the wall from the outside. Pass the terminal through the inner wall plate and push into the last section of vent pipe until the mark made in Step (g) is no longer visible (Figure 7.34d). Secure the terminal to the last piece of pipe with three #10 x 1/2" sheet metal screws. Drill a 1/8 hole through both outer pipes to start these screws. **Use a drill stop or other means to ensure that the drill bit does not penetrate more than 3/8" into the outer pipe. Do not use a sheet metal screw longer than 1/2".**
i) Slip the outer wall plate over the terminal and secure to the wall (Figure 7.34d). Apply a 1/8" bead of weather resistant RTV over the joint between the outside wall plate and the terminal. Secure the other wall plate to the inside wall.

---

**Figure 7.34a: Dimension “L”, 80/125mm Horizontal Terminal**

**Figure 7.34b: Cutting Outer Pipe Of 80/125mm Horizontal Terminal**
Figure 7.34c: Cutting Inner Pipe Of 80/125mm Horizontal Terminal

Figure 7.34d: Completing 80/125mm Horizontal Terminal Installation
6) **Vertical Terminal Installation** - In addition to the vertical terminal, either a Flat Roof Flashing (PN 230533) or Sloped Roof Flashing (PN 230535) is required for this installation.

   a) Determine the center line of the terminal location on the roof. If the roof is flat, cut a 5-1/2” diameter hole for the terminal. If the roof is sloped, cut a hole large enough for the terminal to pass through the roof while remaining plumb. **Caution:** If the boiler is installed directly under the hole, cover it while cutting the hole to prevent saw dust and other debris from falling into the boiler.

   b) Install the roof flashing using standard practice for the roofing system on the structure.

   c) If not already done, assemble the venting system inside the building. The last section of pipe needs to be on the same center line as the terminal and within 19-1/4” of the top edge of the roof flashing (Figure 7.35a).

   d) Measure distance “H” from the top edge of the storm collar to the end of the last fitting as shown in Figure 7.35a.

   e) Add 1” to distance “H”. Carefully mark this length on the pipe as shown in Figure 7.35b.

   f) Cut the outer pipe only at the point marked in Step (e) using aviation shears, a hacksaw, or an abrasive wheel cutter. Be careful to cut the pipe square. De-burr the cut end with a file or emery cloth.

   g) Place a mark on the aluminum inner pipe 3/8” beyond the end of the outer pipe (Figure 7.35b). Use a fine tooth hacksaw to cut the aluminum pipe and be careful to cut the pipe square. De-burr the cut edge of the aluminum pipe with a file or emery cloth.

   h) Make a mark on the terminal section 1” from the cut end of the outer pipe as shown in Figure 7.35b.

   i) Slip the terminal section through the roof from the outside. Push into the last section of vent pipe until the mark made in Step (h) is not longer visible. Secure the terminal to the last piece of pipe with three #10 x 1/2” sheet metal screws. Drill a 1/8 hole through both outer pipes to start these screws. **Use a drill stop or other means to ensure that the drill bit does not penetrate more than 3/8” into the outer pipe. Do not use a sheet metal screw longer than 1/2”**.

   j) Secure the terminal section to the inside of the roof structure using the mounting bracket provided with the terminal Figure 7.35c).

7) **Chimney Chase Installation** - A vertical 80/125mm vent system can be installed in an unused masonry chimney. This installation is similar to other vertical installations with the following exceptions (Also see Figure 7.36):

   a) The chimney chase elbow kit (PN230530) is used at the base of the chimney. This kit consists of a support elbow and a mounting bracket. Slip the elbow over the M10 x 35 screw in the support bracket. Determine the desired vertical location of the support elbow in the chimney and mark the location of the pin on the back of the support bracket on the back wall of the chimney. Drill a 7/16” dia x 2-1/2” deep hole at this location to support the back of the bracket. The front of the elbow mounting bracket is supported by the bottom of the opening into the chimney or by an installer supplied bracket.

   b) Construct a weather-tight flat roof to cover the top of the old chimney. Install the vertical terminal through this roof using the flat roof flashing.
Figure 7.35b: Cutting Vertical Terminal

Figure 7.35c: Completing Vertical Terminal Installation
WARNING

- Do not attempt to construct a vertical vent system inside a chimney that is used to vent a fireplace or other appliances.
- Do not attempt to construct a vertical vent system inside a chimney flue adjacent to another flue used by a fireplace or other appliances.

Figure 7.36: Chimney Chase Installation
E. Condensate Trap and Drain Line

All condensate which forms in the boiler or vent system leaves the boiler through the condensate trap. This trap allows condensate to drain while retaining flue gases in the boiler. This boiler is supplied with a length of drain hose already attached. Route this hose to a drain or other suitable location to dispose of the condensate. Note the following when disposing of the condensate:

- If the condensate drain line must be extended, construct the extension from PVC or CPVC pipe. Insert the hose provided with the boiler into the end of the extension as shown in Figure 7.40.
- Condensate is slightly acidic. Do not use metallic pipe or fittings in the condensate drain line. Do not route the drain line through areas that could be damaged by leaking condensate.
- Some jurisdictions may require that the condensate be neutralized before being disposed of. Dispose of condensate in accordance with local codes.
- Do not route, or terminate, the condensate drain line in areas subjected to freezing temperatures.
- If the point of condensate disposal is above the trap, it will be necessary to use a condensate pump to move the condensate to the drain. In such cases, select a condensate pump that is approved for use with condensing furnaces. If overflow from this pump would result in property damage, select a pump with an overflow switch and use this switch to shut down the boiler. Alternatively, if heat is a necessity, use the overflow switch to trigger an alarm.
- Do not attempt to move the trap from the location shown in Figure 7.40. Do not attempt to substitute another trap for the one provided with the boiler.

**WARNING**

Failure to install the condensate trap and condensate drain in accordance with the above instructions could cause flue gas to enter the building, resulting in personal injury or death.

**CAUTION**

Boiler condensate is corrosive. Route condensate drain line in a manner such that any condensate leakage will not cause property damage. Some jurisdictions may require that condensate be neutralized prior to disposal.

![Figure 7.40: Condensate Piping Arrangement](image-url)
VIII Gas Piping

Gas piping to the boiler must be sized to deliver adequate gas for the boiler to fire at the nameplate input at an inlet pressure between the minimum and maximum values shown on the rating plate. For more information on gas line sizing, consult the utility or the National Fuel Gas Code ANSI Z223.1/NFPA 54 and/or CAN/CSA B 149.1 Natural Gas and Propane Installation Code.

The gas line is connected to the boiler using the 3/4” NPT female connection in the tailpiece shown in Figure 8.1. This tailpiece is supplied in the boiler’s fitting package, along with the fiber gasket shown.

Figure 8.2 shows the finished gas piping connection to the MWC boiler. A sediment trap must be installed upstream of all gas controls. Install the factory provided manual shut-off valve outside the jacket with a ground joint union as shown.

The boiler and its gas connection must be leak tested before placing the boiler in operation. When doing this, the boiler and its individual shut-off must be disconnected from the rest of the system during any pressure testing of that system at pressures in excess of 1/2 psi. When pressure testing the gas system at pressures of 1/2 psi or less, isolate the boiler from the gas supply system by closing its individual manual shut-off valve.

Figure 8.1: Gas Tailpiece Installation
Figure 8.2: Gas Connection To Boiler
IX System Piping

CAUTION

- Install boiler so that the gas ignition system components are protected from water (dripping, spraying, rain, etc) during appliance operation and service (circulator replacement, etc).
- Operation of this boiler with continuous return temperatures below 86°F can cause severe heat exchanger corrosion damage.
- Operation of this boiler in a system having frequent additions of make-up water can cause severe heat exchanger damage.
- Do not use toxic additives, such as automotive antifreeze, in a hydronic system.
- Before connecting boiler, make sure that the system is free of sediment, flux and any residual boiler water additives. Flush the system if necessary to ensure that these contamminates are removed.

A. Standard Piping

Figure 9.1 shows typical boiler system connections on a single zone system. Additional information on hydronic system design may be found in Installation of Residential Hydronic Systems (Pub. #200) published by the Hydronics Institute in Berkeley Heights, NJ. The components in this system and their purposes are as follows:

1) Relief valve (Included & Required) – Install the relief valve in the 3/4” connections on the top of the boiler as shown in Figure 9.3. The relief valve shipped with the boiler is set to open at 30 psi. This valve may be replaced with one having a setting at or below the Maximum Allowable Working Pressure (MAWP) shown on the ASME plate attached to the heat exchanger. If the valve is replaced, the replacement must have a relief capacity in excess of the Minimum Relief Valve Capacity shown on the rating plate.
   Pipe the discharge of the relief valve to a location where water or steam will not create a hazard or cause property damage if the valve opens. The end of the discharge pipe must terminate in an unthreaded pipe. If the relief valve discharge is not piped to a drain, it must terminate at least 6 inches above the floor. Do not run relief valve discharge piping through an area that is prone to freezing. The termination of the relief valve discharge piping must be in an area where it is not likely to become plugged by debris.

DANGER

- Pipe relief valve discharge to a safe location.
- Do not install a valve in the relief valve discharge line.
- Do not move relief valve from factory specified location.
- Do not plug relief valve discharge.

2) Circulator (Included & Required) – This boiler is equipped with a factory piped circulator, which is often the only circulator required. Figure 9.2 is a performance curve for this circulator. Note that this curve is has been adjusted to take into the account of all internal boiler piping. This performance curve therefore shows the amount of flow that can be achieved at various heating system pressure drops.

3) Throttling Valve or Flow Restrictor - This boiler is equipped with a differential pressure switch to prove that there is flow through the boiler before allowing it to fire. Reliable operation of this switch requires that there be a head loss across the heating system of at least 5.1ft wc. In order to assure that this head loss will always be present, either a throttling valve must be installed as shown in Figure 9.1 or the flow restrictor shown in Figure 9.4 must be installed.
   Use the following guidelines to determine which device to use:
   - If the boiler is installed an a single zone system, or one having zone valves, install the throttling valve. At start-up, start with this valve fully open and then close it just enough to obtain reliable operation of the pressure switch.
   - If the boiler is connected to a primary-secondary system (Figure 9.5), install the orifice in the supply tailpiece as shown in Figure 9.4.
   - If the boiler is connected to a circulator zone system, primary-secondary piping must be used. Install the orifice as shown in Figure 9.4.
4) **Expansion Tank (Included & Required)** – This boiler is equipped with a built-in expansion tank. This tank is suitable for use on systems having a water content of up to 40.6 Gal. This tank is pressurized to approximately 14.7 psi.

5) On systems having water content in excess of 40.6 gallons, a second expansion tank must be provided. Locate this tank as close as possible to the return connection on the boiler.

6) As shipped, the expansion tank is suitable for installations where the vertical distance between the relief valve and the highest point in the system is 23ft or less. Consult the factory if it is desired to install this boiler on a system having a greater height.

7) **Fill Valve (Required)** – Either a manual or automatic fill valve may be used. Connect the fill as shown in Figure 9.1.

8) **Automatic Air Vent (Included & Required)** – The boiler is equipped with an automatic air vent. Manual vents will usually be required in other parts of the system to remove air during initial fill.

9) **Low Water Protection** – This boiler is equipped with a flow switch which will only allow the boiler to fire when there is flow through the boiler, and therefore water in the heat exchanger.

10) **Isolation Valves (Optional - Not Shown)** – Isolation valves are useful if the boiler must be drained, as they will eliminate having to drain and refill the entire system.

11) **Drain Valve (Required)** – Install a 3/4" boiler drain (not supplied) in the return piping as shown in Figure 9.1.
Boiler supply and return connections are located on the bottom of the boiler as shown in Figure 9.4. Copper 3/4” tail pieces are provided in the fitting bag along with gaskets. Sweat the first copper fittings to these tail pieces and then connect the tail pieces to the boiler using the gaskets provided. If required, install the flow restrictor in the supply as shown in Figure 9.4.

The relief valve is installed using the union connection on top of the boiler as shown in Figure 9.3. Route the relief valve discharge to a safe location as described on Page 36.

Figure 9.3: Relief Valve Installation
C. Piping for Special Situations

Certain types of heating systems have additional requirements. Some examples follow:

1) **Primary-Secondary Piping** – Primary-secondary piping is required when circulator zoning is used or when the system flow rate must be greater than 5.5 GPM. In these cases, the piping shown in Figure 9.5 is used so that the flow through the system is completely independent of the flow through the boiler. This ensures reliable operation of the boiler’s flow switch.

   When assembling the piping shown in Figure 9.5, be sure to observe the minimum dimensions shown. The minimum pipe size of the primary piping in the vicinity of the tees is 1 1/4". At least 11" (8 diameters) of 1-1/4" straight pipe must be installed upstream of the tees as shown. At least 5 1/2" (4 diameters) of 1-1/4" straight pipe must be installed downstream of the tees.

2) **Piping with a Chiller** – If the boiler is used in conjunction with a chiller, pipe the boiler and chiller in parallel as shown in Figure 9.6. Use isolation valves to prevent chilled water from entering the boiler.

3) **Air Handlers** – Where the boiler is connected to air handlers through which refrigerated air passes, use flow control valves in the boiler piping or other automatic means to prevent gravity circulation during the cooling cycle.

D. Internal Boiler Piping

Schematics of the internal boiler piping are shown in Figures 9.7 and 9.8 for the MWC116E*T (combi) and MWC116E*L (heat-only) models respectively. A schematic of the internal domestic hot water piping for the MWCE*T is shown in Figure 10.3.
Figure 9.5: Primary-Secondary Piping

Figure 9.6: Chiller Piping
Figure 9.7: MWC116E*T (Combi) Internal Boiler-Side Piping Schematic

Notes:
1) Bypass Valve, 3-Way Valve, and Water Pressure Switch are physically combined into one assembly.
2) Air Vent, Pressure Gauge Tap, and Expansion Tank are physically connected into inlet side of Circulator body.
3) Bypass Valve is normally closed.
4) Differential Water Pressure Switch closes when pressure difference between supply and return exceeds 5.1 ftwc
Figure 9.8: MWC116E*L (Heat-Only) Internal Piping Schematic

Notes:
1) Bypass Valve, and Water Pressure Switch are physically combined into one assembly.
2) Air Vent, Pressure Gauge Tap, and Expansion Tank are physically connected into inlet side of Circulator body.
3) Bypass Valve is normally closed
4) Differential Water Pressure Switch closes when pressure difference between supply and return exceeds 5.1 ftwc
X. Domestic Water Piping

CAUTION

If the MWC is connected to a water supply having a hardness in excess of 200PPM, scale may prematurely form in the DHW heat exchanger, significantly shortening its life. If necessary, soften the water upstream of the cold water connection to the MWC.

If the MWC is equipped for domestic hot water (DHW) production, connect the domestic hot water piping as shown in Figure 10.1. Connections to the boiler are made with 1/2" copper tail pieces as shown in Figure 10.2. Solder the first fitting to these tail pieces before mounting them on the boiler. The components in this system and their functions are as follows:

1) Anti-scald Devices (Required - Not Shown) - Install anti-scald protection devices in accordance with local codes. In the absence of any local Codes, install such devices as required by the Uniform Plumbing Code (IAPMO UPC).

WARNING

Like all domestic water heaters, the MWC is capable of generating water that is hot enough to cause injury or death due to scalding. To minimize the risk of scalding:

- Set domestic hot water (DHW) thermostat as low as possible (see the Start-up Section of this manual for the location of this thermostat.
- Feel water before showering or bathing.
- If anti-scald or anti-chill protection is required, use devices specifically designed for such service. Install and maintain these devices in accordance with the manufacturer's instructions.

2) Flow Restrictor (Recommended) - If domestic hot water is drawn from the MWC at a rate in excess of the rating in Table 2.2, the temperature of the hot water may be too low to be of use. The use of a flow restrictor will prevent this problem by limiting the rate at which water can pass through the DHW heat exchanger. If a restrictor is used, select one having a rating in GPM approximately equal to that shown in Table 2.2.

3) Pressure Relief Valve (Required) - Limits the pressure in the domestic hot water piping. Use a valve designed for DHW service, such as the Watts #3L or #53L. Note that this is a pressure relief valve, not a T&P valve. Select a valve with a pressure setting less than or equal to 145 psi. Pipe the discharge to a safe location using piping the same size as the discharge connection on the valve.

4) Hose Bib Valves (Recommended) - These valves permit the DHW plate heat exchanger be periodically "back flushed" to remove sediment.

5) Globe or Ball Valve (Recommended) - Used to aid in back flushing the heat exchanger and to isolate the DHW piping if it must be serviced. In addition, the upstream valve may be used to limit the DHW flow if necessary.
Figure 10.1: DHW Piping

Figure 10.2: DHW Tailpiece Installation
Figure 10.3: MWC116E*T (Combi) Internal DHW-Side Piping Schematic

Notes:
1) Flow Switch and Filter are physically combined into one assembly.
2) Flow Switch Contacts are magnetically linked to Flow Switch Plunger.
XI Wiring

WARNING
All wiring and grounding must be done in accordance with the authority having jurisdiction or, in the absence of such requirements, with the National Electrical Code (ANSI/NFPA 70), and / or, the Canadian Electrical Code Part I ,CSA C22.1,Electrical Code.

1) All electrical connections are line voltage (120 VAC) and are located under the cover on the top of the control box (Fig 11.1). To access these connections, use the following procedure:

   a) Remove the three screws on the top of the front jacket panel and lift off the panel.
   b) There are three screws in the bottom of each side jacket panel: two near the front and one near the back. Remove the two screws near the front and loosen the screw near the back.
   c) Spread the side jacket panels apart slightly, slide the control box forward and then rotate the control box down as shown in Figure 11.1.
   d) Remove the cover shown in Figure 11.1 to access the electrical connections.

2) Crown supplies the “Whip” shown in Figure 11.2 to route the power and thermostat wiring from an installer supplied junction box into the boiler’s control box. This Whip is designed to provide proper strain relief at the boiler and also permits the control box to be easily slid in and out of the boiler with all wiring connections intact. A 7/8 hole is located in the metal rail behind the control box as shown in Figure 11.3. Power and thermostat wiring is routed into the boiler underneath (Figure 11.5) and the BX connector on the “boiler end” of the Whip is secured in this 7/8” opening.

3) Route the whip leads into the electrical connection compartment. DO NOT CUT THE WHIP LEADS ON THE BOILER END.

4) Two terminal blocks are located in the electrical connection compartment: one for power connections and one for the thermostat connections. Figure 11.3 shows the location of these terminal blocks in the connection compartment.

5) Connect the whip leads to the terminals as shown in Figure 11.4:

<table>
<thead>
<tr>
<th>Whip Color</th>
<th>To Factory Wire Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Black</td>
<td>Brown</td>
<td>120VAC “Hot”</td>
</tr>
<tr>
<td>White</td>
<td>Blue</td>
<td>120 VAC Neutral</td>
</tr>
<tr>
<td>Green</td>
<td>Green/Yellow</td>
<td>Ground</td>
</tr>
<tr>
<td>Orange (either)</td>
<td>Blue</td>
<td>120VAC Thermostat</td>
</tr>
<tr>
<td>Orange (either)</td>
<td>Red</td>
<td>120VAC Thermostat</td>
</tr>
</tbody>
</table>

   Important: Remove the factory installed jumper from the thermostat terminals (Figure 10.4)

6) Reinstall the compartment cover removed in Step #1d.

7) Figure 11.5 shows connections at the junction box end of the whip. Provide a dedicated circuit for the boiler with at least one emergency shut-off switch located in accordance with applicable codes. The thermostat connections provided are 120VAC. If a thermostat is directly connected to these leads, it and all intervening wiring, must be suitable for use with 120VAC power. If it is desired to control the boiler with a low voltage thermostat, or other low voltage control system, use a fan center to do so as shown in Figure 11.6

WARNING
Attempting to directly connect a low voltage thermostat and/or low voltage wiring to the orange thermostat leads could cause property damage and/or create hazard of fire or electricituion.
Figure 11.3: Location of Terminal Blocks and 7/8 Hole for Whip

Figure 11.4: Electrical Connections Inside Control Box.
Figure 11.5: Field Wiring - 120VAC Thermostat

Figure 11.6: Field Wiring - 24V Thermostat Using Installer-Supplied Fan Center
Caution: Label all wires prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation. Verify proper operation after servicing.

Figure 11.7: Internal Boiler Wiring
XII Start-up and Checkout

NOTE
Safe lighting and other performance criteria were met with the gas train assembly provided on the boiler when the boiler underwent the tests specified in Z21.13.

WARNING
Never attempt to fill a hot empty boiler

Use the following procedure for initial start-up of the boiler:

1) If not already done, flush the system to remove sediment and debris. This should be done with the boiler isolated from the system.

2) Fill the boiler and hydronic system with water and purge the system of air. To do this:
   a) Unscrew the cap on the automatic air vent by one turn and leave open permanently. This air vent is located on top of the circulator (Figure 12.1).
   b) Open the fill valve and pressurize the boiler to approximately 15 psi.
   c) Bleed air out of each manual air vent in the system until a steady stream of water appears. Start with the lowest manual vents in the system and work towards the highest. If a manual fill valve is used, periodically add water to the system so that the pressure at the boiler is maintained at approximately 15 psi.
   d) Remove the shaft cover screw on the front of the circulator (Figure 12.2). Using a screwdriver, manually spin the shaft in the direction of rotation shown on the pump until a small amount of water appears at the end of the shaft. Replace the shaft cover screw.
   e) At the end of the purging process, make sure that the pressure gauge on the boiler reads between 5 and 19 psi.
   f) Make sure that a manual air vents are closed. If an automatic fill valve is used, make sure that it is set to the automatic position.

Figure 12.1: Location of Automatic Air Vent Cap
3) Check all new water and gas piping for leaks and purge piping sections that are filled with air. Fix any leaks found immediately. See the National Fuel Gas Code ANSI Z223.1/NFPA 54 and/or CAN/CSA B 149.1 Natural Gas and Propane Installation Code, for additional information on testing and purging gas lines.

4) Vent system must be complete and free of obstructions before attempting to fire boiler.

5) Inspect all line voltage wiring for loose or uninsulated connections.

6) Start the boiler using the lighting instructions on page 56. After the power to the boiler is turned on:
   a) Initiate a call for heat from the thermostat. Once this is done, Lamp 1 on the control panel (Figure 12.3) should flash every 4 seconds.
   b) Rotate the Heating System Knob clockwise from “0” to the maximum supply water temperature setting (at approximately 5:00). Lamp 1 should then flash every two seconds and the boiler should light after approximately 15 - 30 seconds. Once the boiler has lit, Lamps 1 and 3 will flash continuously.

More information on the boiler controls and indicator lamps is presented in the Operation Section of this manual. Note: On a new installation, there is a good chance that one of the following two problems will occur:

- The differential water pressure switch may not close. If this switch does not close after 180 seconds, the boiler will lockout. Lamp #2 will stay on continuously and Lamp #1 will flash. If this happens, look for air in the system or insufficient pressure drop across the boiler supply and return connections. If the latter problem is suspected, close the throttle valve on the supply further. If no throttling valve is present, make sure that the flow restrictor is installed (See Part IX). To reset the boiler, turn the Heating System Knob to “0” for a few seconds and then return it to the max water temperature setting.

WARNING

- Never use a flame to check for gas leaks.
- Make sure that the area around the boiler is clear and free from combustible materials, gasoline and other flammable vapors and liquids

CAUTION

Leaks in the hydronic system can result in the addition of excessive amounts of make-up water. This can cause severe damage to the boiler’s heat exchanger from corrosion or calcium deposits. Repair any leaks in the system immediately.
The burner may not light on the first try. The most likely cause of this problem on a new installation is a gas line that has not been completely purged. Other possibilities include inadequate inlet gas pressure or a boiler that is configured for the wrong fuel. If the boiler does not light on the first try, it will go into a lockout condition. When this happens, the Flame Lockout Lamp (Figure 12.3) will be illuminated. In addition, Lamps 1 and 3 will flash and Lamp 2 will be on continuously. To reset the boiler, push the Flame Reset Button shown in Figure 12.3 AND rotate the Heating System Knob back to “0” for a few seconds.

7) Inspect the flame visible through the window. The flame should be stable and mostly blue (Fig.12.4). No yellow tipping should be present; however, intermittent flecks of yellow and orange in the flame are normal.

8) Check the inlet and manifold pressures. To do this, use the following procedure:

a) Remove the inner cover (figure 12.5). Note: this is necessary in order to read the manifold pressure accurately because the gas valve regulator is referenced to the burner area.
b) Loosen the screw in the gas inlet tap on the gas valve and connect a manometer (see Figure 12.6).
c) Make sure the boiler is at high fire. To do this:

   • On heat only boilers, make sure that the heating system knob is rotated fully clockwise and that
     the supply temperature is less than 150°F during the entire conduct of this test.
   • For combi units, rotate the DHW knob fully clockwise and open enough hot water fixtures to keep
     the exiting hot water temperature under 110°F during the entire conduct of this test.

d) Check the inlet pressure with all the MWC, and all other gas appliances turned on and off. The inlet
pressure at the boiler must be within the following limits regardless of what combination of appliances
is firing:

<table>
<thead>
<tr>
<th>Inlet Press. (inches w.c.)</th>
<th>Natural Gas</th>
<th>LP Gas</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum</td>
<td>5.6</td>
<td>10.4</td>
</tr>
<tr>
<td>Maximum</td>
<td>10.5</td>
<td>13.0</td>
</tr>
</tbody>
</table>

If the inlet pressure falls outside of these limits, find and correct the cause of the problem before
proceeding further.

e) Connect a manometer to the manifold (outlet) pressure tap on the gas valve (Figure 12.6).
f) Read the high fire manifold pressure. It should be set at:

<table>
<thead>
<tr>
<th>Manifold Press. (inches w.c.)</th>
<th>Natural Gas</th>
<th>LP Gas</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.8 +/-0.25” w.c.</td>
<td>10.3 +/- 0.50” w.c.</td>
<td></td>
</tr>
</tbody>
</table>

g) If an adjustment is necessary, pry the clear plastic cap off of the regulator. Turn the outer brass nut
clockwise to increase the manifold pressure or counter-clockwise to reduce the pressure.
h) Check the low fire manifold pressure. To do this, turn off the boiler and remove one of the modulation
leads (Figure 12.6). Turn the boiler back on. Read the low fire manifold pressure. It should be set at:

<table>
<thead>
<tr>
<th>Model Number</th>
<th>Fuel</th>
<th>L.F. Manifold Pressure (in w.c.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MWC116ENL (Heat Only)</td>
<td>Natural</td>
<td>2.2 +/- 0.10</td>
</tr>
<tr>
<td>MWC116ELL (Heat Only)</td>
<td>LP</td>
<td>4.8 +/- 0.10</td>
</tr>
<tr>
<td>MWC116ENT (Combi)</td>
<td>Natural</td>
<td>1.0 +/-0.10</td>
</tr>
<tr>
<td>MWC116ELT (Combi)</td>
<td>LP</td>
<td>2.0 +/-0.10</td>
</tr>
</tbody>
</table>

i) If an adjustment is necessary, turn the inner black hex shaft clockwise to increase the manifold
pressure or counter-clockwise to reduce the pressure (Figure 12.7).
j) Turn off the boiler, reconnect the modulation lead removed in Step (h) and restart the boiler.
k) Recheck the manifold pressure at high fire
l) Recheck the inlet pressure
m) Replace the inner cover.
Figure 12.5: Inner Cover Removal

Figure 12.6: Gas Pressure Taps

Figure 12.7: Gas Pressure Adjustments (Pry Off Transparent Cover to Access)
FOR YOUR SAFETY READ BEFORE OPERATING

**WARNING**: If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

A This appliance does not have a pilot. It is equipped with an ignition device which automatically lights the burner. Do not try to light the burner by hand.

B BEFORE OPERATING smell all around the appliance area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.

**WHAT TO DO IF YOU SMELL GAS**
- Do not try to light any appliance.
- Do not touch any electric switch; do not use any phone in your building.
- Immediately call your gas supplier from a neighbor’s phone. Follow the gas supplier’s instructions.
- If you cannot reach your gas supplier, call the fire department.

C Use only your hand to push in or turn the gas control knob. Never use tools. If the knob will not push in or turn by hand, don’t try to repair it, call a qualified service technician. Force or attempted repair may result in a fire or explosion.

D Do not use this appliance if any part has been under water. Immediately call a qualified service technician to inspect the appliance and to replace any part of the control system and any gas control which has been under water.

OPERATING INSTRUCTIONS

1. STOP! Read the safety information above on this label.
2. Turn off all electric power to the appliance.
3. Set the thermostat to lowest setting.
4. This appliance is equipped with an ignition device which automatically lights the burner. Do not try to light the burner by hand.
5. Close main gas shut off valve.
6. Wait five (5) minutes to clear out any gas. Then smell for gas including near the floor. If you smell gas STOP! Follow “B” in the safety information above on this label. If you don’t smell gas, go to next step.
7. Open the main gas shut off valve and the valve on the domestic cold water inlet pipe.
8. Turn on the electricity supply to the boiler, switching on the circuit breaker. The appliance operation light 1 (figure 1) will flash every 4 seconds (stand—by condition).
9. If the boiler is to be used for c.h and d.h.w position the function selector 2 as in figure 2. The appliance operation light 1 will flash every 2 seconds (operating boiler). Position the knobs 2 and 3 for the desired c.h. and d.h.w. temperature (for detailed information see the user manual).
10. If the boiler is to be used for d.h.w. only position the function selector 2 as in figure 3. The appliance operation light 1 will flash every 2 seconds (operating boiler). Position the knob 3 for the desired d.h.w. temperature (for detailed information see the user manual).
11. If the appliance will not operate, follow the instructions “To turn off gas to appliance” and call your service technician or gas supplier.

TO TURN OFF GAS TO APPLIANCE

1. Turn off all electric power to the appliance if service is to be performed.
2. Turn the boiler off by setting the function selector 2 to the position shown in figure 1.
3. Set the thermostat or other operating control to lowest setting
4. Close the main gas shut off valve and the valve on the domestic cold water inlet pipe.
9) Remove the monometer and make sure that the inlet and manifold pressure tap screws are closed.

10) Check the entire gas train for leaks. Fix any leaks found immediately.

11) Run the gas valve safety shut-down test. With the boiler firing, close the gas cock upstream of the boiler. The gas valve should close as soon as loss of flame is detected (within a few seconds of closing the gas cock). The boiler should then make one attempt to relight before going into a hard lockout. To reset the boiler, push the red reset button, rotate the heating system knob back to zero for a few seconds, then rotate the heating system knob fully clockwise.

12) Run a combustion test with the boiler operating at high fire. CO2 or O2 readings should be reasonably close to the values shown in Table 12.8. The CO level should be less than 50PPM. Consult the factory if the CO level is exceeded or if the CO2 or O2 are significantly different from the values shown.

<table>
<thead>
<tr>
<th>Fuel</th>
<th>Approx. O2 (%)</th>
<th>Approx. CO2 (%)</th>
<th>Maximum CO (PPM)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Natural Gas</td>
<td>9.7</td>
<td>6.3</td>
<td>50</td>
</tr>
<tr>
<td>Propane</td>
<td>9.5</td>
<td>7.5</td>
<td>50</td>
</tr>
</tbody>
</table>

13) Verify that the flue system is tight and securely assembled in accordance with the Venting section in this manual.

14) Replace all jacket panels.

15) After the boiler has operated for at least 30 minutes recheck the boiler and system for leaks. Repair any leaks found before leaving the boiler in operation.

16) Test any external limits or other controls in accordance with the manufacturer’s instructions.

17) Verify that the boiler starts and stops in response to calls for heat from the heating thermostat/s. Make sure that the appropriate circulators also start and stop in response to the thermostats.

18) Set the Heating System Knob and the DHW knob for the desired target supply and DHW temperatures (see the Operation section for more information on how to do this).
XIII Operation

Figure 13.1 shows the control panel for the MWC boiler. The purpose of the adjustments and lamps on this panel are as follows:

1) **Lamps 1, 2, 3** - These lamps show the status of the boiler by lighting and/or flashing in various combinations. Table 13.4 shows lamp codes that will be seen during normal operation. Lamp codes indicating a problem are shown in Section XV.

2) **Heating System Knob** - A detail of the heating system knob is shown in Figure 13.2. This knob has three discrete settings:
   - **Off** - Boiler will not respond to a call for heat or domestic hot water (DHW). The boiler will fire, if necessary, to protect itself from freezing. In addition, it will operate the circulator and the 3-way valve for a few seconds every 24 hours to prevent these devices from sticking.
     The "Off" setting is also used to reset the boiler after it experiences a lockout. To reset the boiler, rotate the Heating System Knob to "Off" for a few seconds and then return it to its original position (if the lockout is due to a loss of flame, it will ALSO be necessary push the Flame Reset Button).
   - **Summer Operation (Combi Only)** - Boiler will not respond to a call for heat from the heating thermostat, but will respond to a call for DHW.
   - **Target Supply Temperature Setting** - When the Heating System Knob is rotated clockwise to any position from “Off” the boiler will respond to a call for heat. During the call for heat, the boiler will attempt to maintain a “target” supply temperature. This target supply temperature can be set anywhere between 100F and 178F (Figure 13.2).

3) **DHW Thermostat (Combi Boilers Only)** - This knob determines the target domestic hot water (DHW) temperature. It is adjustable from 95F to 131F (Figure 13.3). If a call for heat is present at the same time as a call for DHW, the call for DHW has priority; no heat will be delivered to the heating system until the call for DHW is satisfied.

4) **Flame Reset Button** - This button is used to reset the boiler in the event that it locks out due to failure to establish a flame. In addition to pressing this button, it is also necessary to rotate the Heating System Knob back to “0” for a few seconds to reset the boiler.

5) **Flame Lockout Lamp** - Illuminates if the boiler locks out due to failure to establish a flame.
WARNING

The domestic water thermostat on the Maui is not intended to serve as a scald protection device. Under certain conditions, it is possible for the DHW temperature to climb significantly above the DHW Thermostat set point. Like all domestic water heaters, the MWC is capable of generating water that is hot enough to cause injury or death due to scalding. To minimize the risk of scalding:

- Set domestic hot water (DHW) thermostat as low as possible (see the Start-up Section of this manual for the location of this thermostat).
- Feel water before showering or bathing.
- If anti-scald or anti-chill protection is required, use devices specifically designed for such service. Install and maintain these devices in accordance with the manufacturer's instructions.

NOTE

Since a room thermostat will almost always be used to initiate a call for heat (either directly or through zone controls), it is generally recommended that the Heating System Knob be left at the appropriate Target Supply Temperature year round.

Figure 13.2: Heating System Knob

Target Supply Temp = 100°F

Off

Summer Operation

Target Supply Temp = 178°F

Figure 13.3: Domestic Hot Water (DHW) Thermostat

95°F Target DHW Temp

131°F Target DHW Temp
Sequence of Operation
(Also Refer to Figures 9.7, 9.8, 10.3, 11.7)

1) Upon a call for heat from the room thermostat, the circulator is started.

2) If the differential pressure switch connected between the supply and return sees a pressure in excess of 5.1 ft w.c., it closes, allowing the start sequence to continue. If the switch does not see 5.1 ft w.c. after 180 seconds, the boiler goes into lockout.

3) If the common and normally closed contacts on the air pressure switch are made, the inducer starts.

4) The air pressure switch measures the difference between the combustion air pressure in the cabinet and the negative pressure generated at a venturi located in the inducer discharge. In this way it measures the airflow through the boiler. If the pressure across the air pressure switch exceeds approximately 0.64” w.c., the switch will close. If the air pressure does not close after 4 minutes of inducer operation, the boiler will go into lockout.

5) After the air pressure switch closes, current can pass through the normally closed supply water and flue gas safety limits to the ignition module, initiating a call for burner operation.

6) The ignition module generates an ignition spark and opens the valve. The presence of flame is detected through a separate flame rod. If no flame is detected after 10 seconds, the boiler will go into lockout. If the flame is proven and this proof is subsequently lost at any point during the burner cycle, the boiler will attempt to re-light once, then go into lockout.

7) When responding to a call for heat, the boiler will attempt to maintain the target supply temperature selected by the Heating System Knob. The boiler does this by monitoring the supply temperature sensor shown in Figure 9.7/9.8 and modulating the input based on the difference between the current supply temperature and the target supply temperature. Modulation is achieved by varying a 0-24 VDC voltage across a coil on the gas valve regulator (0V=minimum input).

8) If the supply water temperature exceeds the target supply temperature while the call for heat is present, the burner will shut down and the circulator will continue to run. The burner will relight when the supply temperature drops below the target temperature.

9) If the supply temperature exceeds 221°F (which should never happen unless there is a problem with the supply sensor), the manual reset supply water high limit will open.

10) If the condensate trap becomes blocked, the condensate level will rise to the point where it covers two electrical contacts: a contact connected to ground, and a contact in the flame rod lead. The condensate will complete an electrical circuit between these two contacts, grounding out the unrectified flame signal. This will be detected by the ignition module as a loss of flame and result in a lockout.

11) If the flue temperature exceeds 248°F, the manual reset supply water high limit will open. This protects the PPs venting from excessive temperatures.

12) When responding to a call for heat, combi boilers use exactly the same sequence of operation as heat-only models. When a combi boiler receives a call for domestic hot water (DHW), it responds as follows:

   a) The flow switch shown in Figure 11.7 detects a call for DHW draw when a hot water fixture is opened having a flow rate in excess of approximately 0.5 GPM.
   b) The main control drives the 3-way diverting valve so that all boiler water flow is directed though the plate heat exchanger.
   c) If not already running, the circulator starts.
   d) The boiler fires after going through the same start sequence described in steps (3-6) above.
   e) The boiler monitors the exiting DHW temperature using the sensor shown in Figure 11.7. The boiler’s microprocessor control determines the target boiler supply temperature that is needed to meet the DHW demand and modulates the input accordingly.

XIV. Service and Maintenance

IMPORTANT

Warranty does not cover boiler damage or malfunction if the following steps are not performed at the intervals specified.

1) **Continuously:**

   a) Keep the area around the boiler free from combustible materials, gasoline and other flammable vapors and liquids.
   b) Keep the area around the combustion air inlet terminal free from contaminants.
   c) Keep the boiler room ventilation openings open and unobstructed.

2) **Monthly Inspections:**

   a) Inspect the vent system to verify that it is open, unobstructed and free from leakage or deterioration. Call the service technician to make repairs if needed.
   b) Inspect the condensate drain system to verify it is leak tight, open and unobstructed. Call the service technician if the condensate drain system requires maintenance.
   c) Inspect the water and gas lines to verify they are free from leaks. Call the service technician to make repairs if required.
   d) Check the pressure on the boiler and make sure that it is approximately 15psi. If the pressure is less than 5psi, add water to bring the pressure up to 15psi.

3) **Annual Inspections and Service:** In addition to the inspections listed above the following should be performed by a qualified service technician once every year:

   a) Follow the procedure for turning the boiler off found in the MWC Series Lighting and Operating Instructions.
   b) Inspect the wiring to verify the conductors are in good condition and attached securely.
   c) Access the combustion chamber. To do this remove the front and side jacket panels as shown in Figure 11.1 Remove the inner cover as shown in Figure 12.5. Remove the Combustion Chamber cover as shown in Figure 14.1.
   d) Inspect the fins on the primary heat exchanger. If any dirt is observed on the fins, cover the burner to protect it from falling debris and clean the heat exchanger with a soft brush.

   **CAUTION**

   Water leaks can cause severe corrosion damage to the boiler or other system components. Immediately repair any leaks found.

   **CAUTION**

   Label all wires prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation. Verify proper operation after servicing.
WARNING

Soot deposits in the flue passages are a sign that the boiler may be operating at high carbon monoxide (CO) levels. After cleaning the boiler of soot deposits, check the CO level in the flue gas to ensure that the boiler is operating properly.

If it is necessary to check CO, use a combustion analyzer, or other instrument which is designed to measure CO in flue gas (see Start-up section). A CO “sniffer” designed for testing CO levels in ambient air cannot be used to check boiler combustion.

A normal CO reading for an MWC series boiler is less than 50ppm (0.005%). A higher reading is indicative of a combustion problem.

Some causes of excessive CO include:

- Incorrectly sized or drilled burner orifice
- Partially plugged flue passages
- Improper manifold pressure
- Partial blockage of vent or intake system
- Foreign material in burner venturi or burner ports
- Disconnected regulator reference tube
- Damaged fan impeller or housing
- Damaged or missing inducer or flue gas gaskets
- Distorted or missing combustion chamber or flue collector components.
- Flue gas recirculation in damaged or improperly assembled concentric venting

e. Inspect the burner ports for debris. The burner can be cleaned with a soft brush. If the burner shows signs of deterioration, replace it.

f. Inspect the electrodes and flame rod for deposits. Clean as necessary.

g. Disconnect and remove the inducer from the boiler. The inducer is equipped with sealed ball bearings and does not require lubrication. Inspect the impeller and the pressure switch venturi (Figure 14.2) for dirt or debris. Clean as necessary with a soft brush.

h. Inspect the secondary (stainless steel) heat exchanger coil for debris. Clean as necessary by flushing with clean water. A soft nylon brush may be used in accessible areas. Drain and flush the inside of the heat exchanger and condensate collector as required. Do not use any cleaning agents or solvents.

i. Reinstall the inducer. If either of the inducer gaskets show signs of deterioration, replace them.

j. Inspect the vent system and terminal for obstructions and clean as necessary.

k. For direct vent appliances, proper reassembly and rescaling of the vent-air intake system.

l. Inspect internal boiler piping for leaks and/or deteriorating gaskets. Repair as necessary.

m. Remove, inspect, and clean the condensate trap (Figure 14.3). Disconnect the wires from the trap. Use pliers to compress the spring clip on the drain hose (the hose leading from the secondary heat exchanger) and slide it upwards. Disconnect the drain hose from the trap. After removing the condensate trap from the boiler, disassemble the trap in a tray or pan, being careful to note the way in which the float ball and retainer fit into the trap. Flush all parts of the trap with water and reassemble. Reinstall the trap on the boiler.

n. Reinstall the combustion chamber cover, inner cover, and all jacket panels and any wiring removed during the inspection/cleaning process.

o. Perform the start-up and checkout procedure described in Section XII of this manual.
Service Notes

1) Orifice Size – Sea level orifice sizes are:
   - Natural Gas – 1.30 mm
   - LP Gas – 0.85 mm

   Consult your Crown representative for correct orifice sizes for use at altitudes above 2000 ft. Orifice for this boiler cannot be drilled in the field.

2) Operating the Boiler with Inner Cover Removed – For inspection and troubleshooting purposes, this boiler may be started and run with the Inner Cover (Figure 12.5) removed.

3) Pressure Switch – If necessary, the air pressure switch signal may be read using a slant tube or electronic monometer connected across the taps on top of the boiler (Figure 14.4). The N.O. contacts on the pressure switch make, allowing the boiler to fire, when the switch signal exceeds the “make setting” shown below. Once the switch is made, the boiler will fire as long as the pressure at the switch is above the “break setting” shown below. It is normal for the pressure reading across the switch to drop as the boiler heats up.
   - Make Setting - 0.64 w.c.
   - Break Setting - 0.59 w.c.

4) Limit Reset Buttons - Manual reset buttons for the flue temperature and supply water limits are located on the top of the boiler as shown in Figure 14.4. To access the buttons, unscrew the plastic covers.

---

**WARNING**

- Do not leave the boiler in service with the Inner Cover removed.
- Do not attempt to fire this boiler with the Combustion Chamber Cover (Fig. 14.1) removed.

---

XV. Troubleshooting

WARNING

Turn off power to boiler before replacing fuses or working on wiring.

Table 15.1: No Error Code Displayed

<table>
<thead>
<tr>
<th>CONDITION</th>
<th>POSSIBLE CAUSES</th>
</tr>
</thead>
</table>
| Boiler does not run, no lights are on or flashing | • No 120VAC Power at boiler. Check breaker and wiring between breaker panel and boiler.  
• Fuse on main PCB is blown (Figure 15.2). Check for short in boiler wiring, then replace with an identical 4.0A fuse. |
| Lamp 1 flashes every two seconds, but boiler does not respond to a call for heat. | • Problem with thermostat or zone wiring |
| Combi boiler does not respond to a call for domestic hot water (DHW). | • Domestic draw less than 0.5GPM  
• Defective flow switch (LED inside flow switch will glow red when it responds to a call for DHW).  
• Inlet and outlet connections reversed. |
| Combi boiler responds to a call for DHW, but hot water output is inadequate. | • Draw rate is in excess of that shown in Table 2.2  
• Inlet and/or manifold pressures incorrect (see Start-up Section).  
• Plate heat exchanger is fouled.  
• DHW filter is dirty |
| Boiler responds to a call for heat, but room temperature never gets high enough to satisfy room thermostat | • Air in radiation  
• Inlet and/or manifold pressures incorrect (see Start-up Section).  
• No flow, or insufficient flow, through system.  
• Boiler is undersized.  
• Insufficient radiation |
| Boiler short cycles AND heat (or DHW) output is inadequate | • Flue gas recirculation into combustion air  
• See causes for inadequate heat or DHW above |

Push reset button on Flue Temp Limit (Fig 14.4)

Reset Boiler

Does Boiler Start?

Y

Flue Temp Limit was open and will probably open again. Look for:
* Fouled flue passages
* Manifold pressure too high
* Incorrect Burner Orifice

N

Reset Boiler

Push reset button on Supply Temp Limit (Fig 14.4)

Reset Boiler

Does Boiler Start?

N

Supply Temp Limit was open and will probably open again. Look for:
* A problem with the supply sensor
* Water-side blockage in one of the boiler heat exchangers or internal boiler piping

Y

Does Inducer (Fan) start before error code reappears?

N

Air pressure switch is not proving airflow:
* Blockage in Vent or Intake
* Condensate in pressure switch tubing
* Leaking or kinked pressure switch tubing
* Blockage in primary or secondary heat exchanger
* Fouled Inducer Venturi
* Defective air pressure switch

Y

Is 120VAC present across Inducer?

N

Air switch stuck in closed position:
* Condensate in pressure switch tubing
* Kinked pressure switch tubing
* Defective air pressure switch

Y

* Defective Inducer
XVI Parts

The following parts may be obtained from any Crown distributor. To find the closest Crown distributor, consult the area Crown representative or the factory at:

Crown Boiler Co.
Customer Service
P.O. Box 14818
Philadelphia, PA 19134
www.crownboiler.com

C.h. return group and d.h.w. heat exchanger (Model combi)

* Includes items 1, 12, 19
C.h. flow group and three way diverter valve (Model combi)

* Includes items 23, 28, 29, 30, 31, 32, 20, 36
C.h. flow and return groups (Model c.h. only)

* Includes items 20, 28, 29, 30, 31, 32, 36
Pump and main circuit assembly (Model c.h. only)
Connection pipes

* Not for model c.h. only

## Appendix A: Special Requirements For Side-Wall Vented Appliances In The Commonwealth of Massachusetts

**IMPORTANT**

The Commonwealth of Massachusetts requires compliance with regulation 248 CMR 4.00 and 5.00 for installation of side-wall vented gas appliances as follows:

(a) For all side wall horizontally vented gas fueled equipment installed in every dwelling, building or structure used in whole or in part for residential purposes, including those owned or operated by the Commonwealth and where the side wall exhaust vent termination is less than seven (7) feet above finished grade in the area of the venting, including but not limited to decks and porches, the following requirements shall be satisfied:

1. **INSTALLATION OF CARBON MONOXIDE DETECTORS.**

   At the time of installation of the side wall horizontal vented gas fueled equipment, the installing plumber or gasfitter shall observe that a hard wired carbon monoxide detector with an alarm and battery back-up is installed on the floor level where the gas equipment is to be installed. In addition, the installing plumber or gasfitter shall observe that a battery operated or hard wired carbon monoxide detector with an alarm is installed on each additional level of the dwelling, building or structure served by the side wall horizontal vented gas fueled equipment. It shall be the responsibility of the property owner to secure the services of qualified licensed professionals for the installation of hard wired carbon monoxide detectors.

   a. In the event that the side wall horizontally vented gas fueled equipment is installed in a crawl space or an attic, the hard wired carbon monoxide detector with alarm and battery back-up may be installed on the next adjacent floor level.

   b. In the event that the requirements of this subdivision can not be met at the time of completion of installation, the owner shall have a period of thirty (30) days to comply with the above requirements; provided, however, that during said thirty (30) day period, a battery operated carbon monoxide detector with an alarm shall be installed.
2. APPROVED CARBON MONOXIDE DETECTORS.
Each carbon monoxide detector as required in accordance with the above provisions shall comply with NFPA 720 and be ANSI/UL 2034 listed and IAS certified.

3. SIGNAGE.
A metal or plastic identification plate shall be permanently mounted to the exterior of the building at a minimum height of eight (8) feet above grade directly in line with the exhaust vent terminal for the horizontally vented gas fueled heating appliance or equipment. The sign shall read, in print size no less than one-half (1/2) inch in size, “GAS VENT DIRECTLY BELOW. KEEP CLEAR OF ALL OBSTRUCTIONS”.

4. INSPECTION.
The state or local gas inspector of the side wall horizontally vented gas fueled equipment shall not approve the installation unless, upon inspection, the inspector observes carbon monoxide detectors and signage installed in accordance with the provisions of 248 CMR 5.08(2)(a)1 through 4.

(b) EXEMPTIONS: The following equipment is exempt from 248 CMR 5.08(2)(a)1 through 4:

1. The equipment listed in Chapter 10 entitled “Equipment Not Required To Be Vented” in the most current edition of NFPA 54 as adopted by the Board;

2. Product Approved side wall horizontally vented gas fueled equipment installed in a room or structure separate from the dwelling, building or structure used in whole or in part for residential purposes.

(c) MANUFACTURER REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM PROVIDED. When the manufacturer of Product Approved side wall horizontally vented gas equipment provides a venting system design or venting system components with the equipment, the instructions provided by the manufacturer for installation of the equipment and the venting system shall include:

1. Detailed instructions for the installation of the venting system design or the venting system components; and

2. A complete parts list for the venting system design or venting system.

(d) MANUFACTURER REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM NOT PROVIDED. When the manufacturer of a Product Approved side wall horizontally vented gas fueled equipment does not provide the parts for venting the flue gases, but identifies “special venting systems”, the following requirements shall be satisfied by the manufacturer:

1. The referenced “special venting system” instructions shall be included with the appliance or equipment installation instructions; and

2. The “special venting systems” shall be Product Approved by the Board, and the instructions for that system shall include a parts list and detailed installation instructions.

(e) A copy of all installation instructions for all Product Approved side wall horizontally vented gas fueled equipment, all venting instructions, all parts lists for venting instructions, and/or all venting design instructions shall remain with the appliance or equipment at the completion of the installation.
