Safety Labeling and Signal Words

**DANGER, WARNING, CAUTION, and NOTE**

The signal words **DANGER, WARNING, CAUTION, and NOTE** are used to identify levels of hazard seriousness. The signal word **DANGER** is only used on product labels to signify an immediate hazard. The signal words **WARNING, CAUTION, and NOTE** will be used on product labels and throughout this manual and other manuals that may apply to the product.

**DANGER** – Immediate hazards which will result in severe personal injury or death.

**WARNING** – Hazards or unsafe practices which could result in severe personal injury or death.

**CAUTION** – Hazards or unsafe practices which may result in minor personal injury or product or property damage.

**NOTE** – Used to highlight suggestions which will result in enhanced installation, reliability, or operation.

Signal Words in Manuals

The signal word **WARNING** is used throughout this manual in the following manner:

⚠️ **WARNING**

The signal word **CAUTION** is used throughout this manual in the following manner:

⚠️ **CAUTION**

Signal Words on Product Labeling

Signal words are used in combination with colors and/or pictures or product labels.

⚠️ Safety–alert symbol

When you see this symbol on the unit and in instructions or manuals, be alert to the potential for personal injury.

Use of the AHRI Certified™ Mark indicates a manufacturer’s participation in the program. For verification of certification for individual products, go to www.ahridirectory.org.

Printed in U.S.A.
SAFETY CONSIDERATIONS

Improper installation, adjustment, alteration, service, maintenance, or use can cause explosion, fire, electrical shock, or other conditions which may cause death, personal injury, or property damage. Consult a qualified installer, service agency, or your distributor or branch for information or assistance. The qualified installer or agency must use factory–authorized kits or accessories when modifying this product. Refer to the individual instructions packaged with the kits or accessories when installing.

Follow all safety codes. Wear safety glasses, protective clothing, and work gloves. Use quenching cloth for brazing operations. Have fire extinguisher available. Read these instructions thoroughly and follow all warnings or cautions included in literature and attached to the unit. Consult local building codes, the current editions of the National Fuel Gas Code (NFCG) NFPA 54/ANSI Z223.1, and the National Electrical Code (NEC) NFPA 70.

In Canada refer to the current editions of the National standards of Canada CAN/CSA–B149.1 and .2 Natural Gas and Propane Installation Codes, and Canadian Electrical Code CSA C22.1.

Recognize safety information. This is the safety–alert symbol 🚨. When you see this symbol on the unit and in instructions or manuals, be alert to the potential for personal injury. Understand these signal words; DANGER, WARNING, and CAUTION. These words are used with the safety–alert symbol. DANGER identifies the most serious hazards which will result in severe personal injury or death. WARNING signifies hazards which could result in personal injury or death. CAUTION is used to identify unsafe practices which may result in minor personal injury or product and property damage. NOTE is used to highlight suggestions which will result in enhanced installation, reliability, or operation.

⚠️ WARNING

PERSONAL INJURY, AND/OR PROPERTY DAMAGE HAZARD
Failure to carefully read and follow this warning could result in equipment malfunction, property damage, personal injury and/or death.
Installation or repairs made by unqualified persons could result in equipment malfunction, property damage, personal injury and/or death.
The information contained in this manual is intended for use by a qualified service technician familiar with safety procedures and equipped with proper tools and test instruments.
Installation must conform with local building codes and with the Natural Fuel Gas Code (NFCG) NFPA 54/ANSI Z223.1, and National standards of Canada CAN/CSA–B149.1 and .2 Natural Gas and Propane Installation Codes.

⚠️ WARNING

ELECTRICAL SHOCK HAZARD
Failure to follow this warning could cause personal injury or death.
Before performing service or maintenance operations on unit, always turn off main power switch to unit and install lockout tag. Unit may have more than one power switch.

⚠️ WARNING

CARBON MONOXIDE POISONING AND FIRE HAZARD
Failure to follow safety warnings could result in personal injury, death, and/or property damage.
This furnace is not designed for use in mobile homes, trailers or recreational vehicles.

⚠️ CAUTION

CUT HAZARD
Failure to follow this caution may result in damage personal injury.
Sheet metal parts may have sharp edges or burrs. Use care and wear appropriate protective clothing, safety glasses and gloves when handling parts and servicing furnaces.

START-UP, ADJUSTMENT, AND SAFETY CHECK

General

1. Furnace must have a 115-v power supply properly connected and grounded.

NOTE: Proper polarity must be maintained for 115-v wiring. Control status indicator light flashes code 10 and furnace does not operate if polarity is incorrect or if the furnace is not grounded.

2. Thermostat wire connections at terminals R, W/W1, G, Y/Y2, etc. must be made at 24-v terminal block on furnace control. See communicating wall control instructions for proper wiring of communicating controls.

3. Natural gas service pressure must not exceed 0.5 psig (14-in. w.c., 350 Pa), but must be no less than 0.16 psig (4.5-in. w.c., 1125 Pa).

4. Blower door must be in place to complete 115-v electrical circuit and supply power to furnace.

UNIT OPERATION HAZARD

Failure to follow this caution may result in intermittent unit operation or performance dissatisfaction.

These furnaces are equipped with a manual reset limit switch in burner assembly. This switch opens and shuts off power to the gas valve if an overheat condition (flame rollout) occurs in the burner assembly/enclosure. Correct inadequate combustion-air supply, improper gas pressure setting, improper burner or gas orifice positioning, or improper venting condition before resetting switch. DO NOT jumper this switch.

Before operating furnace, check flame rollout manual reset switch for continuity. If necessary, press button to reset switch. EAC-1 terminal is energized whenever blower operates. HUM terminal is only energized when blower is energized in heating.

Select Setup Switch Positions

There are four sets of setup switches on the furnace control board. These switches configure the furnace for correct application requirement. They also select the airflow settings for Air Conditioning and Continuous Fan airflows.

The Setup Switch locations are shown and described on Figure 3, Figure 4, Table 3 and Table 6. The set up switches are also shown on the unit wiring label.

Setup Switches (SW1)

The furnace control has eight setup switches that may be set to meet the application requirements. Refer to Figure 4 and Adjustments section for set up switch configurations.

To set these setup switches for the appropriate requirement:

1. Remove blower door.
2. Locate setup switches on furnace control.
3. Configure the set-up switches as necessary for the application.
4. Replace blower door.

NOTE: If a bypass humidifier is used, setup switch SW1-3 (Min/Int Rise Adjust) should be in ON position. This compensates for the increased temperature in return air resulting from bypass.

NOTE: If modulating dampers are used, blower motor automatically compensates for modulating dampers.

Air Conditioning (A/C) Setup Switches (SW2)

The air conditioning setup switches are used to match furnace airflow to required cooling airflow or high stage cooling airflow when a two-stage outdoor unit is used. Refer to Figure 4 and the Adjustments section for set up switch configurations.

To set the desired cooling airflow:

1. Remove blower door.
2. Locate A/C setup switches on furnace control.
3. Determine air conditioning tonnage used.
4. Configure the switches for the required cooling airflow.

NOTE: Incorrect airflow caused by improper A/C switch setup may cause condensate blow-off or a frozen indoor coil in the cooling mode.

5. Replace blower door.

Continuous Fan (CF) Setup Switches (SW3)

The CF setup switches are used to select desired airflow when thermostat is in continuous fan mode or to select low-cooling airflow for two-speed cooling units. Refer to Figure 4 and the Adjustments section for set up switch configurations.

1. Remove blower door.
2. Locate CF setup switches on furnace control.
3. Determine desired continuous fan airflow or low-cooling airflow.
4. Configure the switches for the required continuous fan or low--cooling airflow.
5. Replace blower door.

Additional Setup Switches (SW4)

The furnace control has three additional setup switches labeled SW4.

Setup switch SW4-2 can be used to lock the furnace into intermediate heat. When setup switch SW4-2 is ON it will over ride setup switch SW1-2 if it is ON. SW4-3 is used to adjust airflow. Refer to Figure 4 and the Adjustments section for set up switch configurations.

1. Remove blower door.
2. Locate setup switch SW4 on furnace control.
3. Configure the switches for the required heat stages airflow if necessary.
4. Replace blower door.

Prime Condensate Trap with Water

WARNING

FIRE OR EXPLOSION HAZARD

Failure to follow these warnings could result in personal injury or death.

Failure to use a properly configured trap or NOT water-priming trap before operating furnace may allow positive pressure vent gases to enter the structure through drain tube. Vent gases contain carbon monoxide which is tasteless and odorless.

CAUTION

UNIT OPERATION HAZARD

Failure to follow this caution may result in intermittent unit operation or performance dissatisfaction.

Condensate trap must be PRIMED or proper draining may not occur. The condensate trap has two internal chambers which can ONLY be primed by pouring water into the inducer drain side of condensate trap.

1. Remove upper and middle collector box drain plugs opposite of the condensate trap. (See Figure 1)
2. Connect field-supplied 5/8-in. (16 mm) ID tube with attached funnel (see Figure 1) to upper collector box drain connection.

Specifications subject to change without notice.
3. Pour one quart (liter) of water into funnel/tube. Water should run through collector box, overfill condensate trap, and flow into open field drain.
4. Remove funnel; replace collector box drain plug.
5. Connect field-supplied 5/8-in. (16 mm) ID tube to middle collector box drain port.
6. Pour one quart (liter) of water into funnel/tube. Water should run through collector box, overfill condensate trap, and flow into open field drain.
7. Remove funnel and tube from collector box and replace collector box drain plug.

Figure 1  Priming Condensate Drain

For proper operation and long term reliability, the Furnace input rate must be within +/− 2 percent of input rate on furnace rating plate, or as adjusted for altitude. The gas input rate on rating plate is for installations at altitudes up to 2000 ft. (610 M).

**Purge Gas Lines**

If not previously done, purge the lines after all connections have been made and check for leaks.

**WARNING**

**FIRE OR EXPLOSION HAZARD**

Failure to follow this warning could result in personal injury, death, and/or property damage.

Never purge a gas line into a combustion chamber. Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections. A fire or explosion may result causing property damage, personal injury or loss of life.

**Adjustments**

**CAUTION**

**FURNACE DAMAGE HAZARD**

Failure to follow this caution could result in reduced furnace life.

DO NOT push or force gas valve adjusting screw. This can result in damage to the adjustment screw resulting in incorrect manifold pressure, which can result in a no heat situation or shorten the life of the heat exchangers.

The NATURAL GAS manifold pressure adjustments in Table 4 and Table 5 compensate for BOTH altitude AND gas heating value. DO NOT apply an additional de−rate factor to the pressures shown in Table 4 or Table 5. The values in these Tables are NOT referenced to sea level; they are AS−MEASURED AT ALTITUDE.

The heating content of natural gas at altitude may already provide for a reduction in capacity or the furnace. Be sure to obtain the expected in−season gas heating value of the gas from the gas supplier BEFORE making any adjustments for capacity or altitude. Refer to Table 4 or Table 5. No adjustments to the furnace may be necessary at altitude for certain gas heating values.

Refer to the instructions provided in the factory-specified LP/Propane conversion kit for instructions for setting gas manifold pressures for LP/Propane applications.

In the USA, the input rating for altitudes above 2000 ft. (610 M) must be reduced by 2 percent for each 1000 ft. (305 M) above sea level. Refer to Table 1. The natural gas manifold pressures in Table 4 and Table 5 adjust for BOTH altitude and natural gas heating value.

In Canada, the input rating must be reduced by 5 percent for altitudes of 2000 ft. (610 M) to 4500 ft. (1372 M) above sea level. The natural gas manifold pressures in Table 4 and Table 5 adjust for BOTH altitude and natural gas heating value.

NOTE: For Canadian altitudes of 200 to 4500 ft. (610 to 1372 M), use USA altitudes of 2001 to 3000 ft. (611 to 914 M) in Table 4 and Table 5.

To adjust manifold pressure to obtain the proper input rate, first, determine if the furnace has the correct orifice installed. At higher altitudes or different gas heat contents, it may be necessary to change the factory orifice to a different orifice. Tables have been provided in the furnace Service and Technical Manual to match the required orifice to the manifold pressure to the heat content and specific gravity of the gas.

NOTE: There are two sets of manifold pressure tables. Use Table 4 for all models EXCEPT *9MAC0602120 Btuh model. Use Table 5 for only the *9MAC0602120 model.
To do this:
1. Obtain average heat value (at installed altitude) from local gas supplier.
2. Obtain average specific gravity from local gas supplier.
3. Find installation altitude range for your installation in the manifold pressure tables. See Table 4 for the 20,000 Btu Max–Heat/8,000/Btu Min–Heat per burner models or Table 5 for model *9MAC0602120 only (20,200 Btu Max–Heat/8,000 Btu Min–Heat per burner).
4. Find closest natural gas heat value and specific gravity in Table 4 or Table 5 depending on furnace gas input rate.
5. Follow heat value and specific gravity lines to point of intersection to find orifice size and maximum and minimum manifold pressure settings for proper operation.
6. Check and verify burner orifice size in furnace. Never assume orifice size. NEVER ASSUME ORIFICE SIZE. ALWAYS CHECK AND VERIFY.

**NOTICE**

If orifice hole appears damaged or it is suspected to have been redrilled, check orifice hole with a numbered drill bit of correct size. Never redrill an orifice. A burr–free and squarely aligned orifice hole is essential for proper flame characteristics.

7. Replace orifice with correct size, if required by Table 4 or Table 5 depending on furnace gas input rate. Use only factory–supplied orifices. See EXAMPLE 1.

**EXAMPLE 1:**
(See Table 4)
0 - 2000 ft. (0 - 609.6M) altitude
Heating value = 1050 Btu/cu ft. Specific gravity = 0.62
Therefore: Orifice No. 44

(Furnace is shipped with No. 44 orifices. In this example, all main burner orifices are the correct size and do not need to be changed to obtain proper input rate.)
Manifold pressure: 3.4-in. w.c. (847 Pa) for Maximum heat, .55-in. w.c. (349 Pa) for Minimum heat

**NOTE:** To convert gas manifold Table pressures to Pascals, multiply the in.w.c. value by 249.1 Pa/in. w.c. (1 in. wc. = 249.1 .55-in. w.c. (349 Pa) for Minimum heat

* Derate multiplier factors are based on midpoint altitude for altitude range.

**CHECK INLET GAS PRESSURE**

The inlet gas pressure must be checked with the furnace operating in maximum heat. This is necessary to make sure the inlet gas pressure does not fall below the minimum pressure of 4.5–in. w.c. for natural gas. The maximum inlet gas pressure is 13.6–in. w.c. If the inlet pressure is too low, you will not be able to adjust the manifold pressure to obtain the proper input rate.

To check the inlet gas pressure:

1. Make sure the gas supply is turned off to the furnace and at the electric switch on the gas valve.
2. Remove the 1/8 inch NPT plug from the inlet pressure tap on the gas valve.
3. Connect a manometer to the inlet pressure tap on gas valve.
4. Turn on furnace power supply.
5. Turn gas supply manual shutoff valve to ON position.
6. Turn furnace gas valve switch to ON position.
7. Jumper the R to W/W1 and W2 thermostat connections at the furnace control board.
8. When main burners ignite, confirm inlet gas pressure is Between 4.5–in. w.c. and 13.6–in. w.c.
9. Remove jumper across thermostat connections to terminate call for heat. Wait until the blower off delay is completed.
10. Turn furnace gas valve electric switch to OFF position.
11. Turn gas supply manual shutoff valve to OFF position.
12. Turn off furnace power supply.
13. Remove manometer from the inlet pressure tap of the gas valve.

**WARNING**

Failure to follow this warning could result in personal injury, death, and/or property damage.

Re–install manifold pressure tap plug in gas valve to prevent gas leak.

**ADJUST MANIFOLD PRESSURE–MAXIMUM HEAT**

The modulating furnace manifold pressure is set at two points. The first point is Maximum Heat.

The second point is Minimum Heat. Do not adjust Intermediate Heat manifold pressure. Intermediate Heat manifold pressure is checked as part of the temperature rise, but is not adjustable. Always adjust Maximum Heat first, then Minimum Heat.

**NOTICE**

DO NOT set maximum heat manifold pressure less than 3.2–in. w.c. (947 Pa) for natural gas. If required manifold pressure is outside this range, change main burner orifices to obtain manifold pressure in this range.

To adjust manifold pressure to obtain input rate for Maximum Heat:

1. Make sure the gas supply is turned off to the furnace and at the electric switch on the gas valve.
2. Remove the 1/8 inch NPT plug from the outlet pressure tap on the gas valve.
3. Connect a manometer to the outlet pressure tap on gas valve.
4. Turn on furnace power supply.
5. Turn gas supply manual shutoff valve to ON position.
6. Turn furnace gas valve switch to ON position.
7. Jumper the R to W/W1 and W2 thermostat connections at the furnace control board.
8. After the main burners ignite and the blower starts, confirm Maximum Heat manifold pressure is correct, based on the manifold pressure tables in the installation instructions.
9. To adjust the Maximum Heat manifold pressure, slowly turn adjusting screw counterclockwise to decrease manifold pressure or clockwise to increase manifold pressure. Turn adjustment no more than one click per second until you obtain the required manifold pressure.
10. Main burner flame should be clear blue, almost transparent.
11. After adjusting the Maximum Heat manifold pressure, remove jumpers across thermostat connections to terminate the call for heat.
12. Wait for blower off-delay to finish then reset 115-v power to furnace.

Adjust Manifold Pressure—Minimum Heat

To adjust manifold pressure to obtain input rate for Minimum Heat:
1. Turn SW1–2 ON at the furnace control. Set up switch SW4–2 must be OFF.
2. Jumper R and W/W1 thermostat connections on control to start furnace.
3. After the main burners ignite and the blower starts, confirm Minimum Heat manifold pressure is correct, based on the manifold pressure tables in the installation instructions.
4. To adjust the Minimum Heat manifold pressure, slowly turn adjusting screw counterclockwise (out) to decrease manifold pressure or clockwise (in) to increase manifold pressure. Turn adjustment no more than one click per second until you obtain the required manifold pressure.
5. After adjusting the manifold pressure, remove jumpers across thermostat connections to terminate heat. Wait until the blower off delay is completed.
6. Move setup switch SW1-2 to the OFF position.
7. Turn gas supply manual shutoff valve to OFF position.
8. Turn off furnace power supply.

**WARNING**

**FIRE HAZARD**
Failure to follow this warning could result in personal injury, death, and/or property damage.
Reinstall manifold pressure tap plug in gas valve to prevent gas leak.

9. Remove manometer from the inlet pressure tap of the gas valve.
10. Apply pipe dope sparingly to end of inlet gas pipe plug and re-install in the gas valve.

11. Re-install cap over adjustment screw on the top of the gas valve.

Clocking the Meter

Verify natural gas input rate by clocking meter.

**NOTE:** Contact your HVAC distributor or gas supplier for metric gas meter Tables, if required.

1. Turn off all other gas appliances and pilots served by the meter.
2. Move setup switches SW1-2 to ON position and SW4-2 to OFF. This keeps furnace locked in Minimum Heat operation when only W/W1 is energized or Maximum Heat operation when R to W/W1 and W2 are jumpered.
4. Measure time (in sec) for gas meter to complete one revolution and note reading. The 2 or 5 cubic feet dial provides a more accurate measurement of gas flow.
5. Refer to Table 3 for cubic ft. of gas per hr. Multiply gas rate cu ft./hr by heating value (Btuh/cu ft.) to obtain input rate.
6. If clocked rate does not match required input from Step 5, increase manifold pressure to increase input or decrease manifold pressure to decrease input. Repeat steps 3 through 5 until correct maximum heat input is achieved.
7. Remove jumpers across thermostat connections to terminate the call for heat. Wait until the blower off delay is completed then reset 115-v power to furnace.
8. Jumper R and W/W1 thermostat connections on control to start furnace.

**NOTE:** Setup switches SW1-2 must be ON and SW4-2 must be OFF. This keeps furnace locked in minimum heat operation when R to W/W1 is energized. Repeat items 3 through 6 for minimum heat operation until minimum heat input is achieved.
9. Restore furnace to normal operating condition.
10. Remove jumpers across thermostat connections to terminate the call for heat. Wait until the blower off delay is completed.
11. Disconnect 115 VAC power to furnace.
12. Turn gas valve ON/OFF switch to OFF.
13. Remove water column manometer or similar device from manifold pressure tap (if still connected).

14. Replace manifold pressure tap plug to gas valve.
15. Turn gas valve ON/OFF switch to ON.
16. Move setup SW1-2 on furnace control to position required for attached thermostat (OFF for single-stage thermostats, ON for two-stage thermostats).
17. Check for gas leaks and verify furnace operation.
Adjust Temperature Rise

**NOTE:** Blower door must be installed when taking temperature rise reading. Leaving blower door off will result in incorrect temperature measurements.

---

**CAUTION**

**FURNACE DAMAGE HAZARD**

Failure to follow this caution may result in:

- Overheating the heat exchangers or condensing flue gases in heat exchanger areas not designed for condensate
- Shortened furnace life
- Component damage

Temperature rise must be within limits specified on furnace rating plate. Recommended operation is at midpoint of rise range or slightly above.

Furnace must operate within ranges of temperature rise specified on the furnace rating plate. When setup switch SW1-4 is ON, operation will be near the high end of the rise range for improved comfort.

Determine air temperature rise as follows:

1. Place thermometers in return and supply ducts as near furnace as possible. Be sure thermometers do not see heat exchanger so that radiant heat does not affect readings. This practice is particularly important with straight-run ducts.
2. When thermometer readings stabilize, subtract return-air temperature from supply-air temperature to determine air temperature rise.

**NOTE:** Temperature rise can be determined for Minimum Heat, Intermediate Heat and Maximum Heat operation by locking the furnace in each mode of operation. The mode of operation is based on the position of Setup switch SW1-2 and SW4-2 on the furnace control board.

The furnace is capable of automatically providing proper airflow to maintain the temperature rise within the range specified on furnace rating plate. If temperature rise is outside this range, proceed as follows:

b. Check derate for altitude if applicable.
c. Check all return and supply ducts for excessive restrictions causing static pressure greater than 0.5-in. w.c.
d. Ensure Min/Int Rise Adjust switch SW1−3 on furnace control is in ON position when a bypass humidifier is used. (See Figure 3 for switch location.)
e. Check Troubleshooting Guide for Variable-Speed Step Modulating Condensing Furnaces.
f. Verify correct model plug is installed.

**To lock the furnace in Minimum Heat:**

1. Turn SW1−2 ON at the furnace control. Set up switch SW4−2 must be OFF.
2. Connect a jumper across R and W/W1 at the thermostat terminals at the furnace control.
3. Allow the burners to ignite and the blower to turn on.
4. Allow the supply temperature to stabilize and verify the proper rise range.

**If the temperature rise is too high or too low in Minimum Heat:**

1. Remove jumpers from R and W/W1.
2. Wait until the blower off delay is completed.
3. Turn 115 VAC power off.
4. Check the position of Set up switch SW1-3. When set to ON, airflow is raised 18% for Minimum Heat and for Intermediate Heat. Factory default position is OFF.
5. Turn 115 VAC power on.

To lock the furnace in Intermediate Heat:
1. Switch SW1-2 OFF and SW4-2 ON at the furnace control.
2. Connect a jumper across R and W/W1 at the thermostat terminals at the furnace control.
3. Allow the burners to ignite and the blower to turn on.
4. Allow the supply temperature to stabilize and verify the proper rise range.

If the temperature rise is too high or too low in Intermediate Heat:
1. Remove jumpers from R and W/W1.
2. Wait until the blower off delay is completed.
3. Turn 115 VAC power off.
4. Check the position of Set up switch SW1-3. When set to ON, airflow is raised 18% for Minimum Heat and for Intermediate Heat. Factory default position is OFF.
5. Turn 115 VAC power on.

To lock the furnace in Maximum Heat:
1. Connect a jumper across R and W/W1 and W2 at the thermostat terminals at the furnace control.
2. Allow the burners to ignite and the blower to turn on.
3. Allow the supply temperature to stabilize and verify the proper rise range.

If the temperature rise is too high or too low in Maximum Heat:
1. Remove jumpers from R and W/W1 and W2.
2. Wait until the blower off delay is completed.
3. Turn 115 VAC power off.
4. Check the position of Set up switch SW1-3. When set to OFF, airflow is raised 10% for Minimum Heat and 17.5% for Maximum Heat. Factory default position is ON.
5. Turn 115 VAC power on.

Adjust Cooling Airflow – High-Speed and Low-Speed Cooling

The ECM blower can be adjusted for a range of airflows for low-speed or high-speed cooling. See Table 3 – Airflow Switch Table, Table 6 – Air Delivery – CFM (with Filter) and Figure 4. Furnace Setup Switches and Descriptions. Depending on the model size, the cooling airflow can be adjusted from 1.5 tons to 6 tons of nominal cooling based on 350 CFM ton.

NOTE: 6 ton airflow will truncate at 2200 CFM on applicable models.

The high-speed or single-speed cooling airflow is adjusted by turning setup switches SW2-1, SW2-2 and SW2-3 either ON or OFF. Select the required airflow from Table 6. Table 6 is based on 350 CFM per ton. For other CFM per ton setup switch selections, see Table 3, Figure 4 and Figure 15. The Continuous Fan airflow selection via setup switches SW3 is also the airflow for low-speed cooling when the furnace is used with a two-speed cooling or heat pump unit. Adjust the Continuous Fan CFM setup switches SW3 to match the airflow required for low-speed cooling. Select the required airflow from Table 6 and Figure 4.

NOTE: The airflow selected via SW3 (low-speed cooling airflow) cannot exceed the airflow selected via SW2 (high-speed cooling airflow). For other CFM per ton setup switch selections, see Table 3 and Figure 4.

NOTE: The airflow settings for SW2 and SW3 selections are the same, EXCEPT for the default values. (See Table 6) For a complete explanation of cooling airflow, refer to the section titled “Sequence of Operation.”

Adjust Continuous Fan Airflow/Low Speed Cooling Airflow

NOTE: When the furnace is used with a two-speed cooling or heat pump unit, the airflow selected for Continuous Fan via setup switch SW3 will also be the airflow used for low-speed cooling, and vice versa.

NOTE: When the furnace is used with a two-speed cooling or heat pump unit, adjust the Continuous Fan CFM setup switches SW3 to match the airflow required for low-speed cooling. Select the required Continuous Fan airflow using setup switches SW3 as shown in Table 3, Figure 4 and Figure 15.

### AIR CONDITIONING (A/C) SETUP SWITCHES

1. **SW 2, AC (Cooling Airflow) SETUP SWITCHES**
   - The AC setup switch selects desired cooling or high stage cooling (two stage units) airflow.
   - See Cooling Air Delivery Tables for specific switch settings

### CONTINUOUS FAN (CF) SETUP SWITCHES

1. **SW 3, CF (Continuous Fan) SETUP SWITCHES**
   - The CF setup switch selects desired Continuous Fan Airflow
   - The CF switch position is the Low Cooling airflow selection for two stage cooling units.
   - SW 3 cannot be set for airflow higher than SW 2
   - See Continuous Fan Air Delivery Tables for specific switch settings

### Adjust Thermostat Heat Anticipator

a. Mechanical thermostat. Set thermostat heat anticipator to match the amp. draw of the electrical components in the R–W/W1 circuit. Accurate amp. draw readings can be obtained at the wires normally connected to thermostat subbase terminals, R and W. The thermostat anticipator should NOT be in the circuit while measuring current.

1. Set SW1–2 switch on furnace control board to ON.
2. Remove thermostat from subbase or from wall.
3. Connect an amp. meter as shown in Figure 5 across the R and W subbase terminals or R and W wires at wall.
4. Record amp. draw across terminals when furnace is in minimum heat and after blower starts.
5. Set heat anticipator on thermostat per thermostat instructions and install on subbase or wall.
6. Turn SW1–2 switch OFF.
7. Install blower door.

b. Electronic thermostat: Set cycle rate for three cycles per hr.
**Check Safety Controls**

The flame sensor, gas valve, and pressure switch were all checked in the Start-up procedure section as part of normal operation.

1. **Check Main Limit Switch**
   This control shuts off combustion system and energizes air-circulating blower motor, if furnace overheats. By using this method to check limit control, it can be established that limit is functioning properly and will operate if there is a restricted return-air supply or motor failure. If limit control does not function during this test, cause must be determined and corrected.
   a. Run furnace for at least five minutes.

2. **Check Pressure Switch(es)**
   This control proves operation of the draft inducer blower.
   a. Turn off 115-v power to furnace.
   b. Disconnect inducer motor lead wires from wire harness.
   c. Turn on 115-v power to furnace.
   d. Set thermostat to “call for heat” and wait 1 minute. When pressure switch is functioning properly, hot surface igniter should **NOT** glow and control diagnostic light flashes a status code 3. If hot surface igniter glows when inducer motor is disconnected, shut down furnace immediately.
   e. Determine reason pressure switch did not function properly and correct condition.
   f. Turn off 115-v power to furnace.
   g. Reconnect inducer motor wires, replace blower door, and turn on 115-v power.
   h. Blower will run for 90 seconds before beginning the call for heat again.
   i. Furnace should ignite normally.

**Checklist**

1. Put away tools and instruments. Clean up debris.
2. Verify that switches SW1–1 and SW1–6 are OFF and other setup switches are set as desired. Verify that switches SW1–7 and SW1–8 for the blower OFF DELAY are set as desired per Table 2.
3. Verify that blower and control doors are properly installed.
5. Check operation of accessories per manufacturer’s instructions.
6. Review Home Owner’s Information with owner.
7. Attach literature packet to furnace.

</table>

1. Nominal 350 CFM/ton cooling airflow is delivered with SW1−3 and SW4−3 set to OFF. Set SW1−5 to ON for nominal 400 CFM/ton (+15% airflow). Set SW4−3 to ON for nominal 325 CFM/ton (-7% airflow). The above adjustments in airflow are subject to motor horsepower range/capacity.

2. Maximum cooling airflow is achieved when switches SW2−1, SW2−2, SW2−3 and SW1−5 are set to ON, and SW4−3 is set to OFF.

3. All heating CFM's are when low/medium heat rise adjustment switch (SW1−3) and comfort/efficiency adjustment switch (SW1−4) are both set to OFF.

4. Ductwork must be sized for high heating CFM within the operational range of ESP. Operation within the blank areas of the chart is not recommended because high-heat operation will be above 1.0 ESP.

5. All airflows on 21” casing size furnaces are 5% less on side return only installations.

6. Side returns for 24.5” casing sizes require two sides, or side and bottom, to allow sufficient airflow at the return of the furnace.

</table>
![WARNING]

**FIRE, INJURY OR DEATH HAZARD**

Failure to follow this warning could result in personal injury, death and/or property damage.

The ability to properly perform service and maintenance on this equipment requires certain knowledge, mechanical skills, tools, and equipment. If you do not possess these, do not attempt to perform any service and maintenance on this equipment other than those procedures recommended in the User's Manual.

---

![CAUTION]

**ENVIRONMENTAL HAZARD**

Failure to follow this caution may result in environmental pollution.

Remove and recycle all components or materials (i.e. oil, refrigerant, control board, etc.) before unit final disposal.

---

![WARNING]

**ELECTRICAL SHOCK, FIRE OR EXPLOSION HAZARD**

Failure to follow this warning could result in personal injury or death, or property damage.

Before installing, modifying, or servicing system, main electrical disconnect switch must be in the OFF position and install a lockout tag. There may be more than one disconnect switch. Lock out and tag switch with a suitable warning label. Verify proper operation after servicing.

---

![CAUTION]

**ELECTRICAL OPERATION HAZARD**

Failure to follow this caution may result in improper furnace operation or failure of furnace.

Label all wires prior to disconnection when servicing controls. Wiring errors can cause improper and dangerous operation.

---

**General**

These instructions are written as if the furnace is installed in an upflow application. An upflow furnace application is where the blower is located below the combustion and controls section of the furnace, and conditioned air is discharged upward. Since this furnace can be installed in any of the four positions shown in *Figure 6*, you must revise your orientation to component location accordingly.

---

**Electrical Controls and Wiring**

![WARNING]

**ELECTRICAL SHOCK HAZARD**

Failure to follow this warning could result in personal injury or death.

There may be more than one electrical supply to the furnace. Check accessories and cooling unit for additional electrical supplies that must be shut off during furnace servicing. Lock out and tag switch with a suitable warning label.

The electrical ground and polarity for 115-v wiring must be properly maintained. Refer to *Figure 7* for field wiring information and to *Figure 15* for furnace wiring information.

**NOTE:** If the polarity is not correct, the STATUS LED on the control will flash code 10 and prevent the furnace from heating. The control system also requires an earth ground for proper operation of the control and flame-sensing electrode.

The 24-v circuit contains an automotive-type, 3-amp. fuse located on the control. (See *Figure 3*) Any shorts of the 24-v wiring during installation, service, or maintenance will cause this fuse to blow. If fuse replacement is required, use ONLY a 3-amp. fuse. The control LED display will be off when fuse needs replacing.

**Troubleshooting**

Refer to the service label. (See *Figure 14*—Service Label)

The Troubleshooting Chart– Flow Chart (See *Figure 16*) can be a useful tool in isolating furnace operation problems. Beginning with the word “Start,” answer each question and follow the appropriate arrow to the next item.

The Chart – Flow Chart will help to identify the problem or failed component. After replacing any component, verify correct operation sequence.

Proper instrumentation is required to service electrical controls. The control in this furnace is equipped with a Status Code LED (Light– Emitting Diode) to aid in installation, servicing, and troubleshooting. Status codes can be viewed at the sight glass in blower access door. The amber furnace control LED is either heartbeat, off or a code composed of 1 or 2 digits. The first digit is the number of short flashes, the second digit is the number of long flashes.
For an explanation of status codes, refer to service label located on blower access door or Figure 14, and the troubleshooting guide which can be obtained from your distributor.

**Retrieving Stored Fault Codes**

The stored status codes will NOT be erased from the control memory, when 115− or 24−v power is interrupted. The control will store up to the last 7 Status Codes in order of occurrence.

1. To retrieve status codes, proceed with the following:

   **NOTE:** NO thermostat signal may be present at control, and all blower−OFF delays must be completed.
   a. Leave 115−v power to furnace turned on.
   b. Look into blower door sight glass for current LED status.
   c. Remove blower door.

   **NOTE:** The Status Codes cannot be retrieved by disconnecting the limit switch. To retrieve Status Codes, follow the procedure below.

   1. Turn Setup Switch, SW1−1 “ON.”
   2. Manually close blower door switch.
   3. Control will flash up to 7 Status Codes.
   4. The last Status Code, or 8th Code, will be a heartbeat.
   5. Turn SW1−1 “OFF.”
   6. A heartbeat amber LED will appear and indicates proper operation.
   7. Release blower door switch, install blower door and or refer to the SERVICE label for more information.

**Component Self−Test**

Component Test can ONLY be initiated by performing the following:

1. Remove blower door.
2. Remove the wire from the “R” terminal of the control board.
3. Turn Setup Switch, SW1−6 “ON.”
4. Manually close blower door switch.

Blower door switch opens 115−v power to control. No component operation can occur unless switch is closed.

Caution must be taken when manually closing this switch for service purposes.

**WARNING**

**ELECTRICAL SHOCK HAZARD**

Failure to follow this warning could result in personal injury, or death.

Blower door switch opens 115−v power to furnace control. No component operation can occur unless switch is closed. Exercise caution to avoid electrical shock from exposed electrical components when manually closing this switch for service purposes.

Component Test sequence will function as follows:

1. The furnace control CPU turns the inducer motor IDM ON at medium speed and keeps it ON through Step 4.
2. The furnace control CPU will test communication with the modulating gas valve GV.
3. After waiting 15 seconds the furnace control CPU turns the hot surface igniter ON for 15 seconds, then OFF.
4. The furnace control CPU then turns the blower motor BLWM ON at mid−range airflow for 15 seconds, then OFF.
5. After shutting the blower motor BLWM OFF the furnace control CPU shuts the inducer motor IDM OFF.

   **NOTE:** The EAC terminals are energized when the blower is operating.

After the component test is completed, 1 or more status codes (heartbeat, 2+5, 3+5, 4+1, 4+2) will flash. See Service label on control door or Service/status Code instructions for explanation of status codes.

   **NOTE:** To repeat component test, turn setup switch SW1−6 to OFF and then back ON.

6. **RELEASE BLOWER DOOR SWITCH**, reattach wire to “R” terminal on furnace control board, replace blower door.
Care and Maintenance

**WARNING**

**FIRE OR EXPLOSION HAZARD**
Failure to follow this warning could result in personal injury, death, and/or property damage.
Never store anything on, near, or in contact with the furnace, such as:
1. Spray or aerosol cans, rags, brooms, dust mops, vacuum cleaners, or other cleaning tools.
2. Soap powders, bleaches, waxes or other cleaning compounds, plastic or plastic containers, gasoline, kerosene, cigarette lighter fluid, dry cleaning fluids, or other volatile fluids.
3. Paint thinners and other painting compounds, paper bags, or other paper products. Exposure to these materials could lead to corrosion of the heat exchangers.

For continuing high performance and to minimize possible furnace failure, periodic maintenance must be performed on this furnace. Consult your local dealer about proper frequency of maintenance and the availability of a maintenance contract.

**WARNING**

**ELECTRICAL SHOCK AND FIRE HAZARD**
Failure to follow this warning could result in personal injury, death, and/or property damage.
Turn off the gas and electrical supplies to the furnace and install lockout tag before performing any maintenance or service. Follow the operating instructions on the label attached to the furnace.

**WARNING**

**CARBON MONOXIDE POISONING AND FIRE HAZARD**
Failure to follow this warning could result in personal injury, death, and/or property damage.
Never operate furnace without a filter or with filter access door removed.

**CAUTION**

**CUT HAZARD**
Failure to follow this caution may result in personal injury.
Sheet metal parts may have sharp edges or burrs. Use care and wear appropriate protective clothing, safety glasses and gloves when handling parts, and servicing furnaces.

The minimum maintenance on this furnace is as follows:
1. Check and clean air filter each month or more frequently if required. Replace if torn.
2. Check blower motor and wheel for cleanliness each heating and cooling season. Clean as necessary.
3. Check electrical connections for tightness and controls for proper operation each heating season. Service as necessary.
4. Inspect burner compartment before each heating season for rust, corrosion, soot or excessive dust. If necessary, have furnace and burner serviced by a qualified service agency.

5. Inspect the vent pipe/vent system before each heating season for water leakage, sagging pipes or broken fittings. Have vent pipes/vent system serviced by a qualified service agency.
6. Inspect any accessories attached to the furnace such as a humidifier or electronic air cleaner. Perform any service or maintenance to the accessories as recommended in the accessory instructions.

**Cleaning and/or Replacing Air Filter**
The air filter arrangement will vary depending on the application.

**NOTE:** If the filter has an airflow direction arrow, the arrow must point towards the blower.

To clean or replace filters, proceed as follows:

1. Turn off electrical supply to furnace.
2. Remove filter cabinet door.
3. Slide filter out of cabinet.
4. If equipped with permanent, washable filter, clean filter by spraying cold tap water through filter in opposite direction of airflow. Rinse filter and let dry. Oiling or coating of the filter is not recommended.
5. If equipped with factory specified disposable media filter, replace only with a factory specified media filter of the same size.
6. Slide filter into cabinet.
7. Replace filter cabinet door.
8. Turn on electrical supply to furnace.

**Blower Motor and Wheel Maintenance**
To ensure long life, economy, and high efficiency, clean accumulated dirt and grease from blower wheel and motor annually.
The inducer and blower motors are pre-lubricated and require no additional lubrication. These motors can be identified by the absence of oil ports on each end of the motor.
The following items should be performed by a qualified service technician. Clean blower motor and wheel as follows:
1. Turn off electrical supply to furnace.
2. Remove blower door.
3. All factory wires can be left connected, but field thermostat and accessory wiring may need to be disconnected depending on their length and routing.
4. If the vent and combustion air pipe passes through the blower compartment, it will be necessary to remove the pipes from the blower compartment.

Disconnect the vent and combustion air pipe by:
- a. Loosen the clamps on the vent couplings and combustion air pipe external to the furnace.
- b. Separate the pipes from the couplings and move them aside.
- c. Loosen the clamps on the vent couplings and combustion air pipe located on the blower shelf.
d. Separate the pipes from the blower compartment and set aside.
e. Remove the couplings from the pipe adapters and set aside.
f. After servicing the blower, reverse steps a through e.
g. Tighten all clamps 15 lb-in.

See Figure 8 for steps 5 through 14.

5. Remove screws securing blower assembly to blower shelf and slide blower assembly out of furnace. Detach ground wire and disconnect blower motor harness plugs from blower motor.

**NOTE:** Blower wheel is fragile. Use care.

6. Clean blower wheel and motor by using a vacuum with soft brush attachment. Be careful not to disturb balance weights (clips) on blower wheel vanes. Do not bend wheel or blades as balance will be affected.

7. If greasy residue is present on blower wheel, remove wheel from the blower housing and wash it with an appropriate degreaser. To remove wheel:
   a. Mark blower wheel location on shaft before disassembly to ensure proper reassembly.
   b. Loosen setscrew holding blower wheel on motor shaft.

**NOTE:** Mark blower mounting arms and blower housing so each arm is positioned at the same hole location during reassembly.

   c. Mark blower wheel orientation and cutoff plate location to ensure proper reassembly.
   d. Remove screws securing cutoff plate and remove cutoff plate from housing.
   e. Remove bolts holding motor mounts to blower housing and slide motor and mounts out of housing.
   f. Remove blower wheel from housing.
   g. Clean wheel per instructions on degreaser cleaner. Do not get degreaser in motor.

8. Reassemble motor and blower wheel by reversing items 7b through 7f. Ensure wheel is positioned for proper rotation.

9. Torque motor mounting bolts to 40 +/- 10 lb-in. when reassembling.

10. Torque blower wheel set screw to 160 +/- 20 lb-in. when reassembling.

11. Verify that blower wheel is centered in blower housing and set screw contacts the flat portion of the motor shaft. Loosen set screw on blower wheel and reposition if necessary.

12. Spin the blower wheel by hand to verify that the wheel does not rub on the housing.

13. Reinstall blower assembly in furnace.

14. Reinstall two (2) screws securing blower assembly to blower deck.

15. Reconnect blower leads to furnace control. Refer to furnace wiring diagram, and connect thermostat leads if previously disconnected.

**NOTE:** Be sure to attach ground wire and reconnect blower harness plugs to blower motor.
Cleaning Burners and Flame Sensor

The following items must be performed by a qualified service technician. If the burners develop an accumulation of light dirt or dust, they may be cleaned by using the following procedure:

**NOTE:** Use a back-up wrench on the gas valve to prevent the valve from rotating on the manifold or damaging the mounting to the burner assembly.

Refer to Figure 9.

1. Disconnect power at external disconnect, fuse or circuit breaker.

2. Turn off gas at external shut-off or gas meter.

3. Remove outer doors and set aside.

4. Turn electric switch on gas valve to OFF.

5. Disconnect the gas pipe from gas valve and remove pipe from the furnace casing.

6. Disconnect the connector harness from gas valve.

7. Disconnect Hot Surface Igniter (HSI) wires from HSI.

9. Support the manifold and remove the four (4) screws that secure the manifold assembly to the burner assembly and set aside. Note the location of the green/yellow wire and ground terminal.

10. Inspect the orifices in the manifold assembly for blockages or obstructions. Remove orifice and clean or replace orifice.

11. Remove the four (4) screws that attach the top plate of the casing to the furnace.

12. Raise top plate up slightly and prop it up with a small piece of wood or folded cardboard.

13. Support the burner assembly and remove the screws that attach the burner assembly to the heat exchanger cell panel.

14. Remove wires from both rollout switches.

15. Slide one-piece burner assembly out of slots on sides of burner assembly.

16. Remove the flame sensor from the burner assembly.

17. (Optional) Remove the Hot Surface Igniter (HSI) and bracket from the burner assembly.

18. Check igniter resistance. Nominal resistance is 40 to 70 ohms at room temperature and is stable over the life of the igniter.

19. Clean burner assembly with a brush and a vacuum.

20. Clean the flame sensor with fine steel wool (0000 grade). Do not use sand paper or emery cloth.

**To reinstall burner assembly:**

1. Install the Hot Surface Igniter (HSI) and bracket in burner assembly.

2. Install flame sensor on burner assembly.

3. Align the edges of the one-piece burner assembly with the slots in the burner assembly and slide the burners forward until they are fully seated in the burner assembly.

4. Align the orifices in the manifold assembly with the support rings on the end of the burner.

5. Insert the orifices in the support rings of the burners.

**NOTE:** If manifold does not fit flush against the burner assembly, do not force the manifold on the burner assembly. The burners are not fully seated forward in the burner assembly. Remove the manifold and check burner positioning in the burner assembly before re-installing the manifold.

6. Attach the green/yellow wire and ground terminal to one of the manifold mounting screws.

7. Install the remaining manifold mounting screws.

8. Check the igniter alignment. See Figure 9, Figure 10 and Figure 11.
9. Attach the wires to the roll-out switches.
10. Align the burner assembly with the openings in the primary cell inlet panel and attach the burner assembly to the cell panel.
11. Connect the wire for the flame sensor.
12. Connect the wire for the Hot Surface Igniter.

**NOTE:** Use propane-resistant pipe dope to prevent leaks. Do not use Teflon tape.

13. Install the gas pipe to the gas valve.

**WARNING**

**FIRE OR EXPLOSION HAZARD**

Failure to follow this warning could result in personal injury, death, and/or property damage.

Never purge a gas line into a combustion chamber. Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections. A fire or explosion may result causing property damage, personal injury or loss of life.

14. Check for gas leaks with a soap and water solution.
15. Turn gas on at electric switch on gas valve and at external shut-off or meter.

16. Turn power on at external disconnect, fuse or circuit breaker.
17. Run the furnace through two complete heating cycles to check for proper operation.
18. Install outer door when complete.

**Servicing Hot Surface Igniter**

The igniter does **NOT** require annual inspection. Check igniter resistance before removal. Refer to Figure 9, Figure 10 and Figure 11.

1. Turn off gas and electrical supplies to furnace.
2. Remove control door.
3. Disconnect igniter wire connection.
4. Check igniter resistance. Igniter resistance is affected by temperature. Only check resistance when the igniter is at room temperature.
   a. Using an ohm meter, check resistance across both igniter leads in connector.
   b. Cold reading should be between 40 ohms and 70 ohms. Resistance reading will increase as igniter temperature increases.
5. Remove igniter assembly.
   a. Using a 1/4−in. driver, remove the two screws securing the igniter mounting bracket to the burner assembly. (See Figure 9)
   b. Carefully withdraw the igniter and bracket assembly through the front of the burner assembly without striking the igniter on surrounding parts.
   c. Inspect igniter for signs of damage or failure.
   d. If replacement is required, remove the screw that secures the igniter on igniter bracket and remove the igniter.
6. To replace igniter and bracket assembly, reverse items 5a through 5e.
7. Reconnect igniter harness to the igniter, dressing the igniter wires to ensure there is no tension on the igniter itself. (See Figure 9)
8. Turn on gas and electrical supplies to furnace.
9. Verify igniter operation by initiating control board self-test feature or by cycling thermostat.
10. Replace control door.

Flushing Collector Box and Drainage System
1. Turn off gas and electrical supplies to furnace.
2. Remove control door.
3. Disconnect pressure switch tube from pressure switch port.

**NOTE:** Ensure the pressure switch tube disconnected from the pressure switch is higher than the collector box opening or water will flow out of tube.
4. Remove one of the collector box plugs from a port on the upper corner of the collector box. (See Figure 1)
5. Attach a funnel with a flexible tube to port on the collector box.
6. Flush inside of collector box with water until discharge from condensate trap is clean and runs freely.
7. Repeat steps 4 through 6 with middle plug on upper corner of collector box.
8. Remove the pressure switch tube from the collector box.

**NOTE:** Do Not blow into tube with tube connected to the pressure switch.
9. Clean pressure switch port on collector box with a small wire. Shake any water out of pressure switch tube.
10. Reconnect tube to pressure switch and pressure switch port.
11. Remove the relief tube from the port on the collector box and the trap.
12. Clean the relief port on collector box and the trap with a small wire. Shake any water out of the tube.
13. Reconnect relief tube to trap and collector box ports.

Cleaning Condensate Drain and Trap

**NOTE:** If the condensate trap is removed, a new gasket between the trap and collector box is required. Verify a condensate trap gasket is included in the service kit or obtain one from your local distributor.
1. Disconnect power at external disconnect, fuse or circuit breaker.
2. Turn off gas at external shut-off or gas meter.
3. Remove outer doors and set aside.
4. Turn electric switch on gas valve to OFF.
5. Disconnect external drain from condensate drain elbow or drain extension pipe inside the furnace and set aside.
6. Disconnect the condensate trap relief hose from collector box port and condensate trap.

**NOTE:** If condensate has a heat pad attached to the trap, trace the wires for the pad back to the connection point and disconnect the wires for the heat pad.
7. Remove the screw that secures the condensate trap to the collector box, remove the trap and set aside.
8. Remove the trap gasket from the collector box if it did not come off when the trap was removed.
9. Discard the old trap gasket.
10. Rinse condensate trap in warm water until trap is clean.
11. Flush condensate drain lines with warm water. Remember to check and clean the relief port on the collector box.
12. Shake trap dry.
13. Clean port on collector box with a small wire.

**To re-install Condensate Drain and Trap:**
1. Remove adhesive backing from condensate trap gasket
2. Install gasket on collector box
3. Align the condensate trap with the drain opening on the collector box and secure the trap with the screw
4. Attach the relief hose to the relief port on the condensate trap and collector box.
5. Secure tubing to prevent any sags or traps in the tubing.
6. Connect condensate drain elbow or drain extension elbow to the condensate trap
7. Connect the leads of the condensate heat pad (if used)
8. Connnect external drain piping to the condensate drain elbow or drain extension pipe.
9. Turn gas on at electric switch on gas valve and at external shut-off or meter
10. Turn power on at external disconnect, fuse or circuit breaker.
11. Run the furnace through two complete heating cycles to check for proper operation
12. Install outer door when complete.

Checking Heat Pad Operation (If Applicable)
In applications where the ambient temperature around the furnace is 32°F (0°C) or lower, freeze protection measures are required. If this application is where heat tape has been applied, check to ensure it will operate when low temperatures are present.

**NOTE:** The Heat Pad, when used, should be wrapped around the condensate drain trap. There is no need to use heat tape within the furnace casing. Most heat tapes are temperature activated, and it is not practical to verify the actual heating of the tape. Check the following:
1. Check for signs of physical damage to heat tape such as nicks, cuts, abrasions, gnawing by animals, etc.
2. Check for discolored heat tape insulation. If any damage or discolored insulation is evident, replace heat tape.
3. Check that heat tape power supply circuit is on.

Cleaning Heat Exchangers
The following items must be performed by a qualified service technician.

Primary Heat Exchangers
If the heat exchangers get an accumulation of light dirt or dust on the inside, they may be cleaned by the following procedure:
corrected, such as improper adjustment of manifold pressure, insufficient or poor quality combustion air, improper vent termination, incorrect size or damaged manifold orifice(s), improper gas, or a restricted heat exchanger (primary or secondary). Action must be taken to correct the problem.

1. Turn off gas and electrical supplies to furnace.
2. Remove control door.
3. Disconnect wires or connectors to flame rollout switch, gas valve, igniter, and flame sensor.
4. Using backup wrench, disconnect gas supply pipe from furnace gas control valve.
5. Remove two screws attaching top filler panel and rotate upwards to gain access to screws attaching burner assembly to cell panel.
6. Remove screws attaching burner assembly to cell panel. (See Figure 9)

NOTE: Burner assembly, cover, manifold, gas valve, and burner assembly should be removed as one assembly.

7. Clean heat exchanger openings with a vacuum and a soft brush. (See Figure 12)

NOTE: After cleaning, inspect the heat exchangers to ensure they are free of all foreign objects that may restrict flow of combustion products.
8. Reverse items 6 through 1 for reassembly.
9. Refer to furnace wiring diagram and reconnect wires to flame rollout switch, gas valve, igniter, and flame sensor.
10. Turn on gas and electrical supplies to furnace.
11. Check furnace operation through 2 complete heat operating cycles. Look through sight glass in burner enclosure to check burners. Burner flames should be clear blue, almost transparent. (See Figure 13)

Secondary Heat Exchangers
The condensing side (inside) of the secondary heat exchanger CANNOT be serviced or inspected without complete removal of the heat exchanger assembly. Detailed information on heat exchanger removal can be obtained from your Distributor.

Winterization

CAUTION

UNIT AND PROPERTY DAMAGE HAZARD
Failure to follow this caution may result in unit component or property damage.
If the furnace is installed in an unconditioned space where the ambient temperatures may be 32° F (0° C) or lower, freeze protection measures must be taken to prevent property or product damage.

Since the furnace uses a condensing heat exchanger, some water will accumulate in the unit as a result of the heat transfer process. Therefore, once it has been operated, it cannot be turned off and left off for an extended period of time when temperatures will reach 32° F (0° C) or lower unless winterized. Follow these procedures to winterize your furnace:

CAUTION

UNIT COMPONENT DAMAGE HAZARD
Failure to follow this caution may result in damage to the furnace and other property damage.
Do not use ethylene glycol (automotive antifreeze coolant or equivalent). Failure of plastic components may occur.

1. Obtain propylene glycol (RV/swimming pool antifreeze or equivalent).
2. Turn off gas and electrical supplies to your furnace.
3. Remove furnace control door.
4. Remove the top unused rubber plug from the port on the collector box opposite the condensate trap. (See Figure 1)
5. Connect a field supplied 3/8-in. (9.5-mm) ID tube to the open port on the collector box
6. Insert a field supplied funnel into the tube.
7. Pour one quart of antifreeze solution into the funnel/tube. Antifreeze should run through the collector box, overfill condensate trap and flow to an open drain.
8. Replace the rubber plug in the port on the collector box.
9. Remove the middle unused rubber plug from the port on the collector box opposite the condensate trap. See Figure 1.
10. Repeat Steps 5 through 8.
11. If a condensate pump is used, check with pump manufacturer to verify pump is safe for use with antifreeze used. Allow pump to start and pump anti-freeze to open drain.
12. Replace main door.
13. When furnace is re-started, flush condensate pump with clear water to check for proper operation before re-starting furnace.
14. Propylene glycol need not be removed before re-starting furnace.

WARNING

FIRE OR EXPLOSION HAZARD
Failure to follow this warning could result in personal injury, death, and/or property damage.
Never purge a gas line into a combustion chamber. Never test for gas leaks with an open flame. Use a commercially available soap solution made specifically for the detection of leaks to check all connections. A fire or explosion may result causing property damage, personal injury or loss of life.

12. Check for gas leaks.
13. Replace control door.

Figure 13 Burner Flame

![Burner Flame Diagram](image_url)

A11461
If status code recall is needed, disconnect the “R” thermostat lead, reset power, and put setup switch “SW1-1” in the ON position. To clear the status code history put setup switch “SW1-1” in the OFF position and jumper thermostat terminals “R”, “WW1”, and “VY2” simultaneously until heartbeat is flashed. Stored status codes are erased automatically after 72 hours or as specified.

LED CODE
CONTINUOUS OFF: - Check for 115 VAC at Neutral and 24VAC at SEC-1 and SEC-2, and 24VAC fuse.

HEARTBEAT ON/STAND ALONE: - Auto-reset after 1 hour if no electrical faults occur.

SOFTWARE CHECK ERROR:

Reset power to clear heartbeat. Replace control if status code repeats.

Each of the following status codes is a single or a digit with the number one determined by the number of short flashes and the second number after the plus (+) sign is the number of long flashes.

OFF: SECONDARY VOLTAGE FUSE IS OPEN: - Check for: - Short circuit in secondary voltage (24VAC) wiring.

3: LOW PRESSURE SWITCH DID NOT OPEN: - Check for: - Obstructed pressure tubing. - Pressure switch stuck closed.

LIMITS:
LIMIT CIRCUIT FAULTS: - Indicates a limit or flame fault, if open, the flame is occurring at maximum heat due to low flow or incorrect air/fuel ratio. Blower will run for 4 minutes or until open switch remains whatever is longer. If open longer than 3 minutes, code changes to “47.” If open less than 3 minute status code 44 continues to flash until blower shuts off. Flame rollout switch requires manual reset. Check for: - Improper limit switch or no limit gasket.

ABNORMAL FLAME-PROVING SIGNAL: - Flame is proved while gas valve is de-energized. Indicator will remain until fault is cleared.

IGNITION PROVING FAULT: - Control will try three times before locking out #1. If flame signal is lost during blower on-duty period, blower will come on for the selected blower off-delay. Check for: - Gas valve defective turned “OFF”

IGNITION LOCKOUT: - Control will not auto reset. Check for: - Mains wired gas valve.

POLARITY: - Check for correct line voltage polarity. Should the units be reversed, check for incorrect line voltage (24V).

COMPONENT TEST
To initiate the component test sequence shut OFF the room thermostat or disconnect the “R” thermostat lead. Reset power and then put setup switch “SW1-1” in the ON position to start the component test sequence. Once initiated the furnace control will turn off the blower ON. The Inducer motor will run for the entire test. The hot surface pressure switch and blower motor will be turned ON for 15 seconds each. When the blower is turned OFF the inducer will be turned OFF. When the component test is completed one or more of the following codes will flash.

CODE
HEARTBEAT - Indicates the inducer and blower motor tested OK. Visual check of hot surface igniter required.

GAS VALVE FAULT - Same as code 2 + 5 above.

BLOWER MOTOR FAULT - Indicates the blower failed to reach 250 RPM or the blower failed to communicate within 30 seconds after being turned ON in two successive heating cycles. Control will auto reset after 3 hours. Refer to status code 4 + 1.

INDUCER MOTOR FAULT - Indicates the inducer has not started within 30 seconds after a call for heat, the inducer motor RPM is outside its valid range of operation, or the inducer RPM signal was lost for 6 seconds during operation. Check for: - Wrong wiring - Restricted combustion air supply - Failed inducer motor - Improper motor wiring.

LOW OR MEDIUM PRESSURE SWITCH OPEN WHILE MEDIUM OR HIGH PRESSURE SWITCH IS CLOSED - Check for: - Proper vent sizing - Correct combustion air supply - Low primary gas pressure - No Sagging pipe - Stuck open low or medium pressure switch.

IGNITION LOCKOUT: - Control will auto reset after 3 hours. Refer to 4 + 1.

DESCRIPTION
- Indicates the inducer and blower motor tested OK. Visual check of hot surface igniter required.

GAS VALVE FAULT - Same as code 2 + 5 above.

BLOWER MOTOR FAULT: - Indicates the blower motor failed test. Check blower, wiring, and flame control.

INDUCER MOTOR FAULT: - Indicates the inducer motor failed test. Check inducer, wiring and flame control.

To repeat component test turn setup switch “SW1-1” OFF and then back ON. After component test is complete put setup switch “SW1-1” in the OFF position and reconnect the “R” thermostat lead.
NOTES:
1. If any of the original equipment wire is replaced use wire rated for 105°C.
2. Use only copper wire between the disconnect switch and the furnace junction box (LB).
3. This wire must be connected to furnace sheet metal for control to prove flame.
4. Symbols are electrical representation only.
5. Solid lines inside PCB are printed circuit board conductors and are not included in legend.
6. Replace only with a 3 amp fuse.
7. Inductor is used with 3/4 hp and 1 hp ECM Blower motors.
8. Factory connected when (LPGPS) not used.
9. Blower off-delay, gas heating selections are (90, 120, 150, 180) seconds, cooling or heat pump 90 seconds or 5 seconds when dehumidify call is active.
10. Ignition lockout will occur after four consecutive unsuccessful trials for ignition. Control will auto-restart after three hours.
11. Any of the 5 wires shown within the NEUTRAL L2 box can be connected to any terminal within the box.
12. Blower motor (BLWM) and Inducer motor (IDM) are locked-rotor overload protected by redundant electronic control circuits.
Troubleshooting Guide

Is AMBER LED status light ON solid, alternately flashing bright-dim-bright-dim like a heartbeat, or flashing ON and OFF?

- YES
  - Is there 115V at L1 and L2?
    - YES
      - Is there 24V at SEC-1 and SEC-2?
        - YES
          - Is the 24V fuse open?
            - YES
              - Replace fuse then disconnect thermostat leads to isolate short circuit.
            - NO
              - Replace furnace control.
        - NO
          - Is the 24V fuse open?
            - YES
              - Replace transformer.
            - NO
              - Replace door switch.
    - NO
      - Is door switch closed?
        - YES
          - Replace door switch.
        - NO
          - Is circuit breaker closed?
            - YES
              - Check for continuity in wire from circuit breaker to furnace.
            - NO
              - Close circuit breaker and go back to START.

- NO
  - Is AMBER LED status light ON solid?
    - YES
      - Is AMBER LED status light alternately flashing bright-dim-bright-dim like a heartbeat?
        - YES
          - Determine status code. The status code is a single or two digit number with the first number determined by the number of short flashes and the second number after the plus (+) sign is the number of long flashes.
            - NO
              - Go to section below for the status code that was flashed.
        - NO
          - Check to make sure that the correct model plug PL4 is installed. The rating plate shows the correct model plug for this furnace. Is the correct model plug installed?
            - NO
              - Replace model plug PL4.
            - YES
              - The last status code has cleared. To recall a previous status code disconnect the R thermostat connection, reset power, and put setup switch SW1-1 in the ON position. The AMBER LED will flash the status codes in the order of occurrence. Record status codes until heartbeat flashes several times the status codes will repeat. Status codes are erased after 72 hours or can be manually erased by putting setup switch SW1-1 in the ON position and jumpering R, W/W1, and Y/Y2 simultaneously until the heartbeat flashes. When done put setup switch SW1-1 in the OFF position.
                - NO
                  - Was there a previous status code other than the heartbeat?
                    - YES
                      - Was there a previous status code other than the heartbeat?
                        - YES
                          - Replace furnace control.
                        - NO
                          - Check room thermostat or interconnecting cable.
                    - NO
                      - Run system through a minimum-heat, maximum-heat, or cooling cycle to check operation. Status codes are erased after 72 hours or can be manually erased by putting setup switch SW1-1 in the ON position and jumpering R, W/W1, and Y/Y2 simultaneously until the heartbeat flashes.
                - NO
                  - Disconnect all the thermostat wires from the furnace control.
            - YES
              - Does the control respond to W/W1, W2, Y1, Y/Y2, and G (24V) thermostat signals?
                - YES
                  - Does the control respond to W/W1, W2, Y1, Y/Y2, and G (24V) thermostat signals?
                    - YES
                      - Replace furnace control.
                    - NO
                      - Run system through a minimum-heat, maximum-heat, or cooling cycle to check operation. Status codes are erased after 72 hours or can be manually erased by putting setup switch SW1-1 in the ON position and jumpering R, W/W1, and Y/Y2 simultaneously until the heartbeat flashes.
                - NO
                  - Disconnect all the thermostat wires from the furnace control.

The thermostat is not compatible with the furnace control. Either install a ballast resistor, connect the Com24V thermostat terminal to the thermostat, or replace the thermostat.

Is 24V present at W/W1, W2, Y1, Y/Y2 or G thermostat terminals on the furnace control?

- YES
  - Does the control respond to W/W1, W2, Y1, Y/Y2, and G (24V) thermostat signals?
    - YES
      - Replace furnace control.
    - NO
      - Run system through a minimum-heat, maximum-heat, or cooling cycle to check operation. Status codes are erased after 72 hours or can be manually erased by putting setup switch SW1-1 in the ON position and jumpering R, W/W1, and Y/Y2 simultaneously until the heartbeat flashes.
- NO
  - Disconnect all the thermostat wires from the furnace control.
  - Does the problem repeat when using a jumper wire?
    - YES
      - Replace furnace control.
    - NO
      - The thermostat is not compatible with the furnace control. Either install a ballast resistor, connect the Com24V thermostat terminal to the thermostat, or replace the thermostat.
2 PRESSURE SWITCH DID NOT OPEN – Check for:
- Obstructed pressure tube.
- Pressure switch stuck closed.

3 LOW PRESSURE SWITCH DID NOT CLOSE OR REOPENED – If open during
blower on-delay period, blower will come on for the selected blower off-delay. If
open within 5 minutes after ignition the next heating cycle will be restricted to
maximum heat. Check for:
- Proper vent sizing.
- Air leak between vestibule and blower compartment.
- Low inlet gas pressure (if LGPS used).
- Restricted vent.
- Disconnected or obstructed pressure switches.
- Excessive wind. If problem persists turn setup switch SW1-6 OFF and
then back ON. Check for:
- Proper vent sizing.
- Air leak between vestibule and blower compartment.

4 LIMIT CIRCUIT FAULT – Indicates the limit or flame rollout switch is
open or the furnace is operating in maximum heat only mode due to 2 successive
limit trips while operating at any rate ≤ 71% of maximum rate. Blower will
run for 4 min. or until open switch remarises whichever is longer. If open longer
than 3 min., code changes to lockout #7. If open less than 3 min., status code #4
continues until gas valve will allow gas to flow.

5 ABNORMAL FLAME-PROVING SIGNAL
Flame is proved while gas valve is deenergized. Inducer will run until fault is
recognized. Check for:
- Stuck open or leaky gas valve.

6 IGNITION PROVING FAILURE – If flame is
not sensed during the trial for ignition period, the control will repeat the
ignition sequence 3 more times before lockout #6 + 1 occurs. If flame signal is
lost during the blower on-delay period, blower will come on for the selected
blower off-delay. Check the following before going to the next step:
- Gas valve turned off.
- GREEN/YELLOW wire MUST be connected to furnace sheet metal.
- Flame sensor must not be grounded.

To determine whether the problem is in the gas
valve, igniter, or flame sensor the system can be
operated in component test mode. To check the
igniter remove the R thermostat lead and set
SW1-1 OFF and then back ON. Check for:
- Inadequate flame carryover
- Rough ignition.

7 ABNORMAL LIMIT CIRCUIT FAULT
Indicates the limit or a flame rollout switch is open or the furnace is operating in
maximum-heat only mode due to 2 successive limit trips while operating at any rate <
71% of maximum rate. Blower will run for 4 min. or until open switch remakes
whichever is longer. If open longer than 3 min., code changes to lockout #7. If open
less than 3 min., status code #4 continues until gas valve will allow gas to
flow.

To determine whether the problem is in the gas
valve, igniter, or flame sensor the system can be
operated in component test mode. To check the
igniter remove the R thermostat lead and set
SW1-1 OFF and then back ON. Check for:
- Inadequate flame carryover
- Rough ignition.

8 IGNITION FAILURE
Indicates the blower failed to reach 250
RPM or the blower failed to communicate with
in the ON position.

To determine whether the problem is in the gas
valve, igniter, or flame sensor the system can be
operated in component test mode. To check the
igniter remove the R thermostat lead and set
SW1-1 OFF and then back ON. Check for:
- Inadequate flame carryover
- Rough ignition.

9 IGNITION FAULT
Indicates the modulating gas valve failed to respond to a command from the
furnace control or power to the gas valve electronics was interrupted. Check for:
- Intermittent RED, YELLOW, or ORANGE wire at gas valve or PL8
connections.

10 IGNITION PROVING FAILURE
Indicates the modulating gas valve failed to respond to a command from the
furnace control or power to the gas valve electronics was interrupted. Check for:
- Intermittent RED, YELLOW, or ORANGE wire at gas valve or PL8
connections.

11 IGNITION LOCKOUT
- System failed to ignite gas and prove
flame in 4 attempts. Control will
auto-reset after 3 hours. Refer to
status code #6.

12 IGNITION SWITCH
- System will auto-reset after 3 hours. Refer to
status code #6.
**Troubleshooting Chart**

**Flow Chart**

1. **4 + 1 BLOWER MOTOR FAULT** – Indicates the blower failed to reach 250 RPM or the blower failed to communicate within the prescribed time limits. Thirty seconds after being turned ON or ten seconds during steady-state operation.
   - Check for:
     - Rubbing blower wheel.
     - Loose blower wheel.
     - Wiring from furnace control to blower motor.
   - Remove the R thermostat connection from the furnace control, disconnect both connectors from the blower motor PL13 and PL14. Does the blower wheel turn freely?
   - NO
   - YES
   - Replace the blower control module attached to the blower motor. Follow the instructions with the blower control module to make sure the entire blower motor does not need to be replaced.

2. **4 + 2 INDUCER MOTOR FAULT** – Indicates the inducer motor has not started within 20 seconds after a call for heat, the inducer motor RPM is outside its valid range of operation, or the inducer RPM signal was lost for 5 seconds during operation.
   - Check for:
     - Proper vent sizing.
     - Failed inducer motor.
     - Restricted combustion air supply.
     - Improper motor wiring.
   - Replace the furnace control.
   - NO
   - YES
   - NO
   - YES
   - Replace the furnace control.

3. **4 + 3 LOW OR MEDIUM PRESSURE SWITCH OPEN WHILE MEDIUM OR HIGH PRESSURE SWITCH IS CLOSED**
   - Check for:
     - Low or Med press. switch stuck open.
     - Disconnected or obstructed pressure tubing.
     - Improper pressure switch wiring.
     - Low inlet gas pressure (if LGPS used).
     - Plugged condensate drain.
     - Water in vent piping, possible sagging pipe.
   - Connect a DC voltmeter across PL13-4 BLUE (+) and PL13-2 GREEN (-). Does the voltage fluctuate as described two steps back?
   - NO
   - YES
   - Replace the blower control module attached to the blower motor. Follow the instructions with the blower control module to make sure the entire blower motor does not need to be replaced.

4. **7 LIMIT CIRCUIT LOCKOUT** – Lockout occurs if the limit or flame rollout switch is open longer than 3 minutes or 10 successive limit trips occurred during maximum-heat. Control will auto-reset after 3 hours. Refer to status code #4.

5. **8 GAS HEATING LOCKOUT** – Control will NOT auto-reset. Turn off power and wait 5 minutes to retry. Check for:
   - Stuck closed gas valve relay on control.
   - Miswire or short to gas valve BLUE wire.

6. **9 MEDIUM PRESSURE SWITCH, HIGH PRESSURE SWITCH OR PSR RELAY DID NOT CLOSE OR REOPENED**
   - Check for:
     - PSR relay may be defective.
     - Refer to status code #3.

7. **10 POLARITY** – Check for correct line voltage polarity. If units are twinned, check for proper low-voltage (24V) transformer phasing.
   - Replace the furnace control.
   - NO
   - YES
   - NO
   - YES
   - Replace the furnace control.

8. **9 MEDIUM PRESSURE SWITCH, HIGH PRESSURE SWITCH OR PSR RELAY DID NOT CLOSE OR REOPENED**
   - Check for:
     - PSR relay may be defective.
     - Refer to status code #3.

9. **10 POLARITY** – Check for correct line voltage polarity. If units are twinned, check for proper low-voltage (24V) transformer phasing.
   - Replace the furnace control.
   - NO
   - YES
   - NO
   - YES
   - Replace the furnace control.

10. **9 MEDIUM PRESSURE SWITCH, HIGH PRESSURE SWITCH OR PSR RELAY DID NOT CLOSE OR REOPENED**
    - Check for:
      - PSR relay may be defective.
      - Refer to status code #3.

11. **10 POLARITY** – Check for correct line voltage polarity. If units are twinned, check for proper low-voltage (24V) transformer phasing.
    - Replace the furnace control.
    - NO
    - YES
    - NO
    - YES
    - Replace the furnace control.
**SEQUENCE OF OPERATION**

---

**CAUTION**

**UNIT OPERATION HAZARD**
Failure to follow this caution may result in intermittent unit operation.

Furnace control must be grounded for proper operation or control will lock out. Control is grounded through green/yellow wire routed to gas valve and manifold bracket screw.

Using the schematic diagram (See Figure 15), follow the sequence of operation through the different modes. Read and follow the wiring diagram very carefully!!

**NOTE:** If a power interruption occurs during a call for heat (W/W1 or W/W1-and-W2), the control will start a 90-second blower-only ON period two seconds after power is restored, if the thermostat is still calling for gas heating. The amber LED light will flash code 1+2 during the 90-second period, after which the LED flash a heartbeat (bright–dim), as long as no faults are detected. After the 90-second period, the furnace will respond to the thermostat normally.

The blower door must be installed for power to be conducted through the blower door interlock switch ILK to the furnace control CPU, transformer TRAN, inducer motor IDM, blower motor BLWM, hot surface igniter HSI, and gas valve GV.

**Communicating Control and Modulating Heating (Adaptive Mode)**

Best comfort will be attained when a communicating wall control is used with this product. Wiring and setup instructions are provided with the communicating control. See the furnace data sheet accessory section for help in selecting the appropriate communicating control for this furnace.

When a communicating control is used, the furnace will modulate through its full operation range, or can be limited via the minimum and maximum CFM capacity configurations.

Operation of the furnace at the beginning and end of each heating cycle will be the same as detailed below in the Single-Stage Thermostat section, EXCEPT that the communicating control will send modulating rate command signals through the communication bus rather than energizing the 24-V thermostat terminals. Note that the R to W/W1 circuit signal will be controlled by the COMMR relay on the furnace control. See the wiring diagram in Figure 15.

**Single-Stage Thermostat and Modulating Heating (Adaptive Mode)**

**NOTE:** Minimum-heat only switch SW1-2 selects the minimum-heat only operation mode when ON. Intermediate-heat only switch SW4-2 selects the intermediate-heat only operation mode when ON. If both switches are ON the furnace control will default to intermediate-heat. If either or both switches are ON, the furnace control will operate at two-stages only as referenced in Two Stage Thermostat section below. If both switches are OFF the furnace control will operate in the adaptive heating mode in response to a call for heat. (See Figure 15) When the W2 thermostat terminal is energized it will always cause maximum-heat operation as long as the R to W circuit is closed, regardless of the setting of the minimum-heat or intermediate-heat only switches.

This furnace can operate as a modulating furnace with a single-stage thermostat because the furnace control CPU includes a programmed adaptive sequence of controlled operation, which selects a modulated rate between minimum- and maximum-heat. This selection is based upon the stored history of the length of previous gas-heating periods of the single-stage thermostat.

The furnace will start up in either intermediate-, or maximum-heat. The furnace will transition and operate at minimum-heat or the calculated modulating rate after starting and operating for 45 seconds at intermediate-heat. The furnace control CPU defaults to minimum-heat on the first thermostat cycle and calculates the modulating rate that the furnace should run at for 19 minutes on subsequent heat cycles.

If the power is interrupted, the stored modulating rate is erased and the furnace control will select intermediate-heat for 45 seconds, minimum-heat for 19 minutes and then switch to maximum-heat, as long as the thermostat continues to call for heat. The furnace control CPU then uses this information to calculate the modulating rate the furnace will operate at on the next heating cycle. If the calculated modulating rate is between 40% - 99% then the furnace control CPU will operate for 45 seconds at intermediate-heat, and then operate at the calculated modulating rate for up to 19 minutes and then switch to maximum-heat as long as the thermostat continues to call for heat. If the calculated modulating rate is 100% then the furnace control will only operate at maximum-heat until the thermostat is satisfied.

The wall thermostat "calls for heat", closing the R to W circuit. The furnace control CPU performs a self-check, verifies the low, medium, and high pressure switch contacts LPS, MPS, and HPS are open, then de-energizes the PSR relay to close the NC contact.

1. **Inducer Prepurge Period** - The furnace control CPU turns on inducer motor IDM and slowly increases the inducer motor speed. After the low pressure switch LPS closes the furnace control CPU continues to increase the inducer motor speed until the medium pressure switch MPS closes. When the medium pressure switch MPS closes, inducer motor RPM is noted by the furnace control CPU, and a 25-second prepurge period begins. The RPM is used to evaluate vent system resistance. This evaluation is then used to determine the required RPM necessary to operate the inducer motor during purge, the first 45 seconds of intermediate-heat, or any modulating rate that the furnace will transition to after the blower on-delay is completed.

**NOTE:** The heat cycle can start in either intermediate- or maximum-heat. If a maximum-heat cycle is initiated, the furnace control CPU will continue to increase the inducer motor speed after the medium pressure switch MPS closes. When the medium pressure switch closes, inducer motor RPM is noted by the furnace control CPU, and a 25-second prepurge period begins. The RPM is used to evaluate vent system restriction. This evaluation is then used to determine the required RPM necessary to operate the inducer motor in maximum-heat pre-purge, or maximum-heat. The high pressure switch HPS should be closed before ignition but the furnace control ignores this input until after ignition occurs.

2. **Igniter Warm-Up** - At the end of the pre purge period, the Hot-Surface Igniter HSI is energized for a 17-second igniter warm-up period

3. **Trial-For-Ignition Sequence** - When the igniter warm-up period is completed the main gas valve relay contact GVR closes to energize the gas valve solenoid GV. The gas valve solenoid GV permits gas flow to the burners where it is ignited. Five seconds after the GVR closes, a 2-second Flame-Proving period begins. The HSI igniter will remain energized until flame is sensed or until the 2-second flame proving period begins.

4. **Flame-Proving** - When the burner flame is proved at the flame-proving sensor electrode FSE, the furnace control CPU begins the blower-ON delay period and continues to hold the gas valve GV open. If the burner flame is not proved within two seconds, the furnace control CPU will

---

**SERVICE AND TECHNICAL SUPPORT MANUAL**

Gas Furnace: (F/G)9MAC

34 Specifications subject to change without notice.

440 04 4201 03
close the gas valve GV, and the furnace control CPU will repeat the ignition sequence for up to three more Trials-For-Ignition before going to Ignition-Lockout. **Lockout** will be reset automatically after three hours, or by momentarily interrupting 115 vac power to the furnace, or by interrupting 24 vac power at SEC1 or SEC2 to the furnace control CPU (not at W/W1, G, R, etc.). If flame is proved when flame should not be present, the furnace control CPU will lock out of Gas-Heating mode and operate the inducer motor IDM at full speed until flame is no longer proved.

5. **Inducer Speed Change** - If the cycle starts in intermediate-heat, the furnace control CPU reduces the inducer speed slightly after flame sense. If cycle starts in maximum-heat, the furnace control CPU increases the inducer speed after flame sense.

6. **Blower-On delay** - If the burner flame is proven, the blower-ON delay for intermediate-heat and maximum-heat are as follows:
   - **Intermediate-heat** - 45 seconds after the gas valve GV is opened the blower motor BLWM is turned ON at the modulating heat airflow.
   - **Maximum-heat** - 25 seconds after the gas valve GV is opened the BLWM is turned ON at maximum-heat airflow.

Simultaneously, the humidifier terminal HUM and electronic air cleaner terminal EAC-1 are energized and remain energized throughout the heating cycle.

7. **Switching from Intermediate-Heat to a Low Range Input** - If the furnace control CPU switches from intermediate-heat to a low range input (low range input is an input rate less than or equal to 51% of full rate), the furnace control CPU will turn the blower ON or switch to the modulating heat airflow, energize the PSR relay to open the NC contact, and slowly decrease the inducer motor speed to the desired inducer RPM.

8. **Switching from Intermediate-Heat to a Medium Range Input** - If the furnace control CPU switches from intermediate-heat to a different medium range input (medium range input is an input rate between 52% and 71% of full rate), the furnace control CPU will turn the blower ON or switch to the modulating heat airflow, and continue to maintain the inducer motor speed or change it further if required.

9. **Switching from Intermediate-Heat to a High Range Input** - If the furnace control CPU switches from intermediate-heat to a high range input (high range input is an input rate greater than or equal to 72% of full rate), the furnace control CPU will turn the blower ON or switch to the modulating heat airflow, and increase the inducer motor speed to the desired inducer motor RPM.

10. **Switching from Low Range Input to Maximum-Heat** - If the furnace control CPU switches from a low range input to maximum-heat, the furnace control CPU will increase the inducer motor speed to the maximum-heat inducer motor RPM. The blower motor BLWM will transition to the maximum-heat airflow five seconds after the furnace control CPU switches from a medium range input to maximum-heat. As the inducer RPM increases, the high pressure switch HPS should close.

11. **Switching from Medium Range Input to Maximum-Heat** - If the furnace control CPU switches from medium range input to maximum-heat, the furnace control CPU will increase the inducer motor speed to the maximum-heat inducer motor RPM. The blower motor BLWM will transition to the maximum-heat airflow five seconds after the furnace control CPU switches from a medium range input to maximum-heat. As the inducer RPM increases, the high pressure switch HPS should close.

12. **Blower-Off Delay** - When the thermostat is satisfied, the R to W circuit is opened, de-energizing the gas valve GV, stopping gas flow to the burners, and humidifier terminal HUM. The inducer motor IDM will remain energized for a 15-second post-purge period. The blower motor BLWM and air cleaner terminal EAC-1 will remain energized at minimum-heat airflow or transition to minimum-heat airflow for 90, 120, 150, or 180 seconds (depending on selection at blower-OFF delay switches). The furnace control CPU is factory-set for a 120-second blower- OFF delay.

**Two-Stage Thermostat and Modulating Heating**

Operation of Modulating Heating (Adaptive Mode; SW1-2 and SW4-2 are both OFF) with a two-stage thermostat is the same as with a single-stage thermostat, EXCEPT for the following:

If the two-stage thermostat R to W2 circuit closes along with the R to W/W1 circuit, while the furnace is operating at any capacity less than maximum, the furnace will switch to the maximum heating capacity. At this point, the furnace control heating algorithm is overridden and the two-stage thermostat takes control of staging until BOTH R to W/W1 and R to W2 circuits are opened.

The furnace will transition back to the lower heating capacity if the two-stage thermostat opens the R to W2 circuit, but leaves R to W/W1 circuit closed. The furnace control will continue to follow the commands from the two-stage thermostat for W/W1 and W2, until the R to W/W1 circuit is opened.

After the two-stage thermostat opens both the R to W/W1 and R to W2 circuits, the adaptive algorithm will set the beginning capacity of the next heating cycle to the same value as the heating cycle that most recently completed.

**Two-Stage Thermostat and Two-Stage Minimum/Maximum Heating**

**NOTE:** In this mode, the minimum-heat only switch SW1-2 must be ON to select the minimum-heat only operation mode in response to closing the thermostat R to W1 circuit. Closing the thermostat R to W1-and-W2 circuits always causes maximum-heat operation, regardless of the setting of the minimum-heat only switch.

The furnace will start up in either intermediate-, or maximum-heat. The furnace will operate in minimum-heat after starting and operating for 1 minute at intermediate-heat before transitioning to minimum-heat.

The wall thermostat "calls for heat", closing the R to W1 circuit for minimum-heat or closing the R to W1-and-W2 circuits for maximum-heat. The furnace control performs a self-check, and verifies the low, medium and high pressure switch contacts LPS, MPS and HPS are open, then de-energizes the PSR relay to close the NC contact.

The start up and shut down functions and delays described above apply to the two-stage minimum/maximum heating mode as well, except for switching from maximum- to minimum-heat.

1. **Switching from Maximum- to Minimum-Heat** - If the thermostat R to W2 circuit opens, and the R to W1 circuit remains closed, the furnace control CPU will gradually decrease the inducer motor speed to the required intermediate-heat RPM. When the inducer motor IDM reduces pressure sufficiently, the high pressure switch
Cooling airflow is based on the A/C selection shown in Figure 4. The thermostat "calls for cooling." After the 5 second blower airflow change delay is completed, the blower airflow will transition to minimum-heat airflow. If the DHUM input is low for more than 48 hours, the furnace control operates in Thermostat Dehumidification Mode.

Dehumidification Mode
The dehumidification output, H on the Thermostat should be connected to the furnace control thermostat terminal DHUM. When there is a demand for dehumidification, the furnace control reduces the cooling airflow to 86% of the true on-board CF selection as shown in Figure 4, Table 3 and Table 6.

Continuous Blower Mode
When the R to G circuit is closed, the blower motor BLWM will operate at continuous blower airflow. Continuous blower airflow selection is initially based on the CF selection shown in Figure 4, Table 3 and Table 6. Factory default is shown in Figure 4, Table 3 and Table 6. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.

Cooling Mode
The thermostat "calls for cooling." cooled and there is a demand for dehumidification, the furnace control reduces the cooling airflow to 86% of the true on-board CF selection as shown in Figure 4, Table 3 and Table 6.

Continuous Blower Mode
When the R to G circuit is closed, the blower motor BLWM will operate at continuous blower airflow. Continuous blower airflow selection is initially based on the CF selection shown in Figure 4, Table 3 and Table 6. Factory default is shown in Figure 4, Table 3 and Table 6. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.

Continuous Blower Mode
When the R to G circuit is closed, the blower motor BLWM will operate at continuous blower airflow. Continuous blower airflow selection is initially based on the CF selection shown in Figure 4, Table 3 and Table 6. Factory default is shown in Figure 4, Table 3 and Table 6. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.

Continuous Blower Mode
When the R to G circuit is closed, the blower motor BLWM will operate at continuous blower airflow. Continuous blower airflow selection is initially based on the CF selection shown in Figure 4, Table 3 and Table 6. Factory default is shown in Figure 4, Table 3 and Table 6. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.

Continuous Blower Mode
When the R to G circuit is closed, the blower motor BLWM will operate at continuous blower airflow. Continuous blower airflow selection is initially based on the CF selection shown in Figure 4, Table 3 and Table 6. Factory default is shown in Figure 4, Table 3 and Table 6. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.

Continuous Blower Mode
When the R to G circuit is closed, the blower motor BLWM will operate at continuous blower airflow. Continuous blower airflow selection is initially based on the CF selection shown in Figure 4, Table 3 and Table 6. Factory default is shown in Figure 4, Table 3 and Table 6. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.

Continuous Blower Mode
When the R to G circuit is closed, the blower motor BLWM will operate at continuous blower airflow. Continuous blower airflow selection is initially based on the CF selection shown in Figure 4, Table 3 and Table 6. Factory default is shown in Figure 4, Table 3 and Table 6. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.

Continuous Blower Mode
When the R to G circuit is closed, the blower motor BLWM will operate at continuous blower airflow. Continuous blower airflow selection is initially based on the CF selection shown in Figure 4, Table 3 and Table 6. Factory default is shown in Figure 4, Table 3 and Table 6. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.

Continuous Blower Mode
When the R to G circuit is closed, the blower motor BLWM will operate at continuous blower airflow. Continuous blower airflow selection is initially based on the CF selection shown in Figure 4, Table 3 and Table 6. Factory default is shown in Figure 4, Table 3 and Table 6. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.

Continuous Blower Mode
When the R to G circuit is closed, the blower motor BLWM will operate at continuous blower airflow. Continuous blower airflow selection is initially based on the CF selection shown in Figure 4, Table 3 and Table 6. Factory default is shown in Figure 4, Table 3 and Table 6. Terminal EAC-1 is energized as long as the blower motor BLWM is energized.
is satisfied, the blower motor BLWM will operate an additional 90 seconds at low-cooling airflow before transitioning back to continuous-blower airflow.

When the thermostat “calls for high-cooling”, the blower motor BLWM will operate at high cooling airflow. When the thermostat is satisfied, the blower motor BLWM will operate an additional 90 seconds at high-cooling airflow before transitioning back to continuous-blower airflow.

When the R to G circuit is opened, the blower motor BLWM will continue operating for an additional 5 seconds, if no other function requires blower motor BLWM operation.

**Heat Pump**

See Thermostat Instructions for thermostat connections. When installed with a heat pump, the furnace control automatically changes the timing sequence to avoid long blower off times during demand defrost cycles. Whenever W/W1 is energized along with Y1 or Y/Y2, the furnace control CPU will transition to or bring on the blower motor BLWM at cooling airflow, minimum-heat airflow, or the mid-range airflow, whichever is lowest. The blower motor BLWM will remain on until the main burners ignite then shut OFF and remain OFF for 25 seconds before coming back on at modulating heat airflow. When the W/W1 input signal disappears, the furnace control begins a normal inducer post-purge period while changing the blower airflow. If Y/Y2 input is still energized the furnace control CPU will transition the blower motor BLWM airflow to cooling airflow. If Y/Y2 input signal disappears and the Y1 input is still energized the furnace control CPU will transition the blower motor BLWM to low-cooling airflow. If both the Y1 and Y/Y2 signals disappear at the same time, the blower motor BLWM will remain on at minimum-heat airflow for the selected blower-OFF delay period. At the end of the blower-OFF delay, the blower motor BLWM will shut OFF unless G is still energized, in which case the blower motor BLWM will operate at continuous blower airflow.

**Component Self Test**

Refer to page 22 for instructions.
PARTS REPLACEMENT INFORMATION GUIDE

Casing Group
Control door
Blower door
Top filler plate
Bottom filler plate
Door Knob Assembly

Electrical Group
Control box
Junction box
Limit switch(es)
Circuit board
Door switch
Transformer
3-Amp fuse
Flame Rollout Switch
Main Wiring Harness
Blower Motor Harness (when used)

Filter Group
Filter(s)

Blower Group
Cut–off Plate
Blower housing
Blower motor
Blower wheel
Capacitor (when used)
Capacitor strap (when used)
Power choke (when used)

Gas Control Group
Manifold
Burner
Orifice
Flame sensor
Hot surface igniter
Gas valve

Heat Exchanger Group
Primary Heat Exchanger assembly
Primary Heat Exchanger cell panel
Secondary Heat Exchanger assembly
Coupling box
Containment Plate
Tubing Gaskets

Inducer Group
Pressure switch(es)
Inducer assembly
Inducer
Inducer motor
Motor Module (when used)
Inducer motor capacitor (when used)

WARNING
FIRE, EXPLOSION, ELECTRICAL SHOCK AND CARBON MONOXIDE POISONING HAZARD
Failure to follow this warning could result in dangerous operation, personal injury, death or property damage. Improper installation, adjustment, alteration, service, maintenance, or use can cause carbon monoxide poisoning, explosion, fire, electrical shock, or other conditions which may cause personal injury or property damage. Consult a qualified installer, service agency, local gas supplier, or your distributor or branch for information or assistance. The qualified installer or agency must use only factory-authorized and listed kits or accessories when modifying this product.

Have available the product/model number and the serial number located on the unit rating plate to ensure correct replacement parts.

TO OBTAIN INFORMATION ON PARTS: Consult your installing dealer or the classified section of your local telephone directory under the “Heating Equipment” or “Air Conditioning Contractors and Systems” headings for dealer listing by brand name.
