

## U.S. Department of Energy - Energy Efficiency and Renewable Energy Energy Savers

### Whole-House Ventilation

The decision to use whole-house ventilation is typically motivated by concerns that [natural ventilation](#) won't provide adequate air quality, even with source control by [spot ventilation](#).

Whole-house ventilation systems provide controlled, uniform [ventilation](#) throughout a house. These systems use one or more fans and duct systems to exhaust stale air and/or supply fresh air to the house. There are four types of systems:

- [Exhaust ventilation systems](#)  
Force inside air out of a home.
- [Supply ventilation systems](#)  
Force outside air into the home.
- [Balanced ventilation systems](#)  
Force equal amounts quantities of air into and out of the home.
- [Energy recovery ventilation systems](#)  
Transfer heat from incoming or outgoing air to minimize energy loss.
