# Submersible Pump Sizing & Selection

Presented by National Exploration, Wells & Pumps

# Office Locations

# Outline

1. Why pump size matters
2. How submersible pumps work
3. Pump parameters
4. Pump selection
5. Maintenance & Repair

Size Matters!

Pump size determines well diameter.

**NOT THE OTHER WAY AROUND!!!**

# Key Parts

1. Discharge

2. Check Valve

3. Impeller

4. Intake

5. Motor

# How it works

1. Each combination of a chamber with an impeller is referred to as a “stage” or “bowl”
2. Each stage adds lift to the pump
3. The impellers are directly connected to the motor which creates flow.
4. As with all variable displacement pumps: flow rate is inversely related to the head pressure.

# Pump Parameters

Q: So what determines the necessary size of the pump?

A: Flow rate & the amount of lift required.

- 1. Flow Rate:** Make sure the aquifer is capable of supporting your desired flow rate. Do you have any pump test data? Why not?
- 2. Lift:** Submersible pumps do not build pressure. They provide lift which overcomes head pressure, which is measured in feet.

The head pressure against which a submersible pump operates is referred to as...

TOTAL DYNAMIC HEAD (TDH)

# Calculating Head

$$\text{TDH} = \text{Pumping Level} + \text{Vertical Rise} + \text{Friction Loss}$$

# Friction Loss Table – VALVES and FITTINGS

(Friction Loss in Equivalent Number of Feet of Straight Pipe)

TYPE OF FITTING AND APPLICATION	PIPE AND FITTING	NOMINAL SIZE OF FITTING AND PIPE						
		1/2"	3/4"	1"	1 1/4"	1 1/2"	2"	2 1/2"
		EQUIVALENT LENGTH OF PIPE(IN FEET)						
Insert Coupling	Plastic	3	3	3	3	3	3	3

Worksheet:

*Peter Piper picked a peck  
of pickled pumps!*

How to size a pump:

1. What is required/desired flow (GPM)
2. Determine TDH
3. Consult Pump Curve(s)
4. Select wire size

## How to size a pump:

What is required/desired flow? 5 GPM

Determine TDH

First, let's calculate friction loss!

Friction loss = total length X friction loss (straight pipe) factor + friction loss (fittings)

Friction loss = (\_\_\_\_' X \_\_\_\_' / \_\_\_\_') + (\_\_\_\_' X \_\_\_\_)

Friction loss = \_\_\_\_' + \_\_\_\_'

Friction loss = \_\_\_\_' Head Pressure

Now we can calculate TDH!

TDH = pumping level + vertical rise + friction loss

TDH = \_\_\_\_' + \_\_\_\_' + \_\_\_\_'

TDH = \_\_\_\_'

Now that we know the TDH and required/desired flow, we can select a pump from a performance curve.

Which 4" pump/motor combination will deliver 5 GPM at the calculated TDH?

\_\_\_\_\_.

$$\text{TDH} = \text{Pumping Level} + \text{Vertical Rise} + \text{Friction Loss}$$

Swing Check Valve <sup>1</sup>	Steel	5	7	9	12	13	17	21

## How to size a pump:

What is required/desired flow? 5 GPM

Determine TDH

First, let's calculate friction loss!

Friction loss = total length X friction loss (straight pipe) factor + friction loss (fittings)

$$\text{Friction loss} = (\underline{922'} \times \underline{1.8' / 100'}) + (\underline{3'} \times \underline{2}) (1.8' / 100')$$

$$\text{Friction loss} = \underline{16.60'} + \underline{.108'}$$

$$\text{Friction loss} = \underline{17'} \text{ Head Pressure}$$

Now we can calculate TDH!

TDH = pumping level + vertical rise + friction loss

$$\text{TDH} = \underline{500'} + \underline{222'} + \underline{17'}$$

$$\text{TDH} = \underline{739'}$$

Now that we know the TDH and required/desired flow, we can select a pump from a performance curve.

PERFORMANCE CURVES

5 GPM

- The gauge of the wire is a function of your operating voltage and length.

# Maintenance & Repair

Q: It's been two years and the bowls are worn out on my submersible pump. What do I do?

A: Go back in time and design a better well screen and filter pack.

A: Okay, you'll have to pull the pump. Go ahead and hire someone with a well service rig. **DON'T TRY IT YOURSELF!**

- Well professionals have the right kind of equipment to pull a submersible pump without damaging the drop pipe, power cable and pump itself.
- You don't.

# Maintenance & Repair

Q: My pump just stopped working.  
What happened?

A: A lot of things could be the problem, but a common issue is motor burn-out.

- If water doesn't flow around the motor housing on its way to the intake, the motor isn't being cooled properly. This can lead to overheating.
- Set your pump above your screen interval but below your dynamic pumping level so water comes from below.
- If conditions preclude this design, consider a shroud.

Thank You

*I should have hired National!*

Worried Project Manager
